Edition Note

Internet Issue

(2007)

The files listed on the internet **do not** contain the complete and final versions of *Mineralogy & Crystallography: a Biobibliography* or the companion book, *Mineralogy & Crystallography: On the History of these Sciences*. Rather these are intermediate presentations of a portion of the computerized database being created to output a final version as printed books. However, even in this incomplete state these works give a substantial history of mineralogy and crystallography together with exhaustive descriptions of the major books. These files are being made available to the general public because of numerous requests for access to the information and the benefit to the compiler in the feedback he receives from the readers. Although it is a work in progress with errors and formatting problems, these intermediate files are still a very useable reference sources.

The *Biobibliography* and the *History* are companion works ultimately intended to each stand complete in itself, but to never the less complement each other, with information from one feeding into the other. This is particularly true of the section labeled “Regional Histories” in the *History*, which describes the development of mineralogy in individual countries. While gathering information for the *History*, an ever increasing number of additional titles are necessarily being added to the *Biobibliography*. Happily however, there is finally an end in sight to the project. It was not possible to create the *History* without having first compiled the *Biobibliography*, and now that it is being written, work on both books is steadily drawing to a point where the text to both can be given a final edit, and be made ready for actual publication as physical books. However, in advance of that future date, these files are being placed on the internet so that researchers and scholars may reference them.

For this project, the T_EX program developed by Donald Knuth professor emeritus of Stanford University has been used to format

the database text and elegantly typeset the volumes directly into the user friendly file format of PDF (Postscript Document Format) developed by Adobe Software. The PDF file format has many advantages, especially since these files can be viewed and printed through the Adobe Reader software, which is readily available. By this method it is possible to distribute electronic versions of the *Biobibliography* and *History* at a very cheap cost. Paper versions of the files can also be created by those individuals who prefer physical copy in their hands. Several paths are available to accomplish this goal. First download the files to your local computer and use either a home computer with a printer to output the over 2,000 pages or take the files to the local copy bureau and have them print the works double-sided and bound into three volumes.

The text of the *Biobibliography* and *History* are of course subject to change (sometimes radical) in the future. In particular, reference numbers for the individual titles listed in the *Biobibliography* unfortunately change because additions and deletions to entries in the source database cause these numbers to increase or decrease, respectively. The files placed on the internet were created in January 2007 in anticipation of the forthcoming 53st Annual Tucson Gem & Mineral Society Show to be held in Tucson, Arizona on February 8-11, 2007.

Since this is a work in progress, comments and suggestions about the content, format or missing entries are welcome by the compiler. The intention is to bring the work to completion within the next few years, so that it can finally be printed as actual physical books. If you wish to contact the compiler, he may be reached through email at the address provided below.

associate, who took an active
interest in this project
from the first day.

Preface

Few people today would claim mineralogy as a science balanced on the edge of significant discovery, but that was not the case in the past. Then, mineralogy and its companion study crystallography were important sciences with each new discovery being widely publicized and debated. Many researchers, some of whom may be counted among the greatest geniuses of the human race, contemplated, investigated and wrote about minerals and crystals. *Mineralogy & Crystallography: A Biobibliography*, attempts in some measure to spotlight these people, their discoveries and their books. It covers the period from the invention of mechanical printing through the first two decades of the twentieth century, and lists thousands of book titles in a variety of languages, many of which are described in bibliographic detail for the first time.

It is a reference intended for collectors, booksellers, librarians and historians of science, who have an interest in the development of mineral studies. Consequently, biographical sketches of all writers notable in the sciences of mineralogy and crystallography are included together with many names that have long since been forgotten by the march of time. It is limited in scope to researchers active in Europe, Russia and the Americas, from the beginning of time until 1920, and is a true biobibliography containing concise biographical notes and copious reference lists about the authors together with annotated bibliographies of their mineralogical and crystallographic books. Effort has been made to include as many biographical references as possible since many of the names listed are obscure and it is hoped that this ready reference will stimulate further research. Complementing each biography is a bibliography of the individual's independent books relevant to mineralogy and crystallography. Sometimes there is a single entry, in other instances many titles are listed. All issues, editions,

translations and abridgments that have been uncovered are recorded in the bibliography. If a copy of the book listed has been physically examined, it is described in full bibliographic detail, with complete pagination, collation, plate descriptions and a moderately detailed page by page recitation of contents. Otherwise as much information as could be located about the book is presented. This includes commentary related to the book's importance in the development of the science, notices of reviews and other references listing the title.

Two prime tests of the value of a bibliography are its accuracy and completeness. As to the first, no reference work consulted is entirely free from error, and it is a certainty that a careful reader will find mistakes in this volume. Hopefully, they are not numerous, and the compiler bears sole responsibility for them. Every bibliographer knows that reference works do not always agree about the facts of a subject's life, but that some sources are more reliable about the facts than others. In general, prominent researchers gain a place in important works such as *Dictionary of Scientific Biography*, in a major national biography (e.g. *Dictionary of American Biography*, *Neue Deutsche Biographie*), or in the biographical memoirs of learned society, and the information provided by these sources is usually reliable. Many contributors to the development of mineralogy and crystallography were not included in such reference works, however, and the confidence in the accuracy of the biographical data that has been traced is only as good as the citation(s) uncovered. For this reason, especially for less well-known researchers, multiple biographical citations (when available) are provided.

This work is intended to fit into a position that has never before been filled. It gives in one convenient work the digested contents of thousands of references with respect to their coverage of the sciences of mineralogy and crystal-

PREFACE

lography, and provides a quick source of lookup for information on many individuals that would otherwise be difficult to trace. It was a work of passion to research, and it is hoped it will be a reference that stimulates the interest in the reader in the history of the sciences of mineralogy and crystallography.

This is an intermediate edition of a large portion of the computerized database, and is

intended to be replaced in the future by the competed work, which will hopefully have far fewer errors and more detail. This issue came about because of the frequent requests for copies of the *Biobibliography*, and the need of the compiler to test various typesetting paradigms. To the unseen reader, I hope you enjoy this work. It represents a substantial investment of my life.

Acknowledgements

A work of this scope could not be completed without the invaluable cooperation of a large number of people and access to many private and public libraries. It has been a privilege to meet and work with the many individuals who because of a shared interest in the history of mineralogy, have freely given of their knowledge in the field and helped to make the descriptions in this work better than they otherwise would have been.

A chance to write the sale catalog of the Frederick H. Pough library in 1982 provided descriptions of many rare mineralogies, especially those containing hand-colored illustrations. Early in the project H. Stanton Hill supplied a duplicate set of photocopies of title pages to books he owned at the time. In addition, some of those contacted during the course of research very kindly invited me into their homes and allowed me unfettered access to their remarkable libraries. These include Alix and Russell Filer, Richard Bideaux, Jeanne and William “Bill” Larson, Adriana and Renato Pagano, Elna and Richard Hauck, and Joseph Freilich. Extended visits to the three outstanding mineralogical libraries of The Mineralogical Record courtesy of Wendell Wilson, Dona and Wayne Leicht and Monika and Herbert Obodda made it possible to fully describe thousands of rare and otherwise unavailable works. The recent work of Google in scanning the books of several important libraries in to their Google-Book project (<http://www.books.google.com/>) has allowed for the inclusion of hundreds of additional descriptions. A similar on-line effort by Microsoft in digitizing volumes from the British Library will in the future perhaps allow for even more volumes to be described.

Linda Winograd and Hugh Saunders helped secure photocopies of title pages of rare items from The United States Geological Library, Reston, Virginia, and The British Library, London, England, respectively, which al-

lowed for their transcriptions to be included. Other collectors who have provided facsimile title pages and descriptions of their books include Petr Sztacho, Ann and Si Fraizer, Mary Murphy, Eric Asselborn, Gilbert Gautier, John Sinkankas, Lawrence Conklin, and Auréle La Rocque. Unexpectedly, Johan Kjellman of the Department of Earth Sciences, Upsala University, Stockholm, Sweden, having heard of this project spent a tremendous amount of time and supplied an outstanding number of fully described entries dealing with Swedish mineralogy and crystallography. Each of his contributions in the biobibliography is happily signed with his name.

A number of booksellers and auction houses have generously answered queries and supplied information about books they have held in inventory. These include Antiquariat Junk, Wheldon & Wesley, Ltd., Bernard Quaritch, Ltd., Zeitlin & Ver Brugge, H.P. Kraus, Jeremy Norman, Jack Garvin, Frank Chambers, Antiquariaat Theo de Boer, W.P. Watson Antiquarian Books (Rick Watson), A. Asher & Co. B.V. (Julius Steiner), Swann Galleries, Rock of Ages (Linda and John Stimson), The Gemmary (Faye and Rick Blankenhorn), Merk’s Jade (Roger Merk), Sotheby’s, Christie’s, Henry Sotheran, Ltd., Reiss & Sohn, and F. Zisska & R. Kistner. Special attention must be given to the booksellers Jonathan Hill, New York City, New York, Antiquariat Andreas Müller, Waldems-Reichenbachand, Germany, and Mary and Ed Rogers, Poncho Springs, Colorado, who have at every opportunity supported this project. Additionally, the dealer catalogs of all these firms and many, many other booksellers of past years have provided citations to obscure references, as well as other bibliographical details of mineralogical and crystallographical books.

Financial assistance in the form of a grant and several gifts helped defer travel and inci-

ACKNOWLEDGEMENTS

dental expenses in conducting the research for this book. In 1996, the Geo-Literary Society showed its support for the *Biobibliography* by providing a grant. In addition, monetary gifts were received from several individuals who wish to remain anonymous. I hope that the finished project is worthy of their early support.

Over the decades this project has progressed, numerous librarians have taken an interest in the project and have arranged for title page reproductions and addressed other biobibliographical matters. It is impossible to mention them all because many remain nameless through the Interlibrary Loan (ILL) process. However, several librarians have consistently given help when it was requested, and special thanks are given to Dona Dirlam of The Richard T. Liddicoat Library, Gemological Institute of America and Leslie Overstreet of The Smithsonian Libraries.

Visits to personally examine the holdings of several institutional libraries have also added detailed information to the biobibliography. These locations include:

ARIZONA STATE UNIVERSITY LIBRARY, TEMPE, AZ.
ARTHUR LAKES LIBRARY, COLORADO SCHOOL OF MINES, GOLDEN, CO.
BRANNER EARTH SCIENCES LIBRARY, STANFORD UNIVERSITY, STANFORD, CA.
HISTORY OF SCIENCE LIBRARY, NORMAN, OK. (PENDING ANOTHER VISIT)
HOOVER COLLECTION OF MINING AND METALLURGY, SPRAGUE LIBRARY, CLAREMONT COLLEGES, CLAREMONT, CA. (PENDING ADDITIONAL VISITS)
CABOT SCIENCE LIBRARY, HARVARD UNIVERSITY, CAMBRIDGE, MA. (PENDING VISIT)

THE RICHARD T. LIDDICOAT LIBRARY, GEMOLOGICAL INSTITUTE OF AMERICA, CARLSBAD, CA. (PENDING VISIT)
LIBRARY OF THE UNITED STATES GEOLOGICAL SURVEY, DENVER, CO.
MINERALOGICAL RECORD LIBRARY, TUCSON, AZ.
NEW YORK PUBLIC LIBRARY, NEW YORK, NY.
RESEARCH LIBRARY, GETTY RESEARCH INSTITUTE, LOS ANGELES, CA. (PENDING VISIT)
UNIVERSITY OF ARIZONA LIBRARY, TUCSON, AZ.
UNIVERSITY OF ILLINOIS LIBRARY, CHAMPAIGN, IL.

Libraries that have supplied title page facsimiles and answered biographical and bibliographical questions with unrelenting cheerfulness include:

ARIZONA STATE UNIVERSITY LIBRARY, TEMPE, AZ.
THE BAKKEN LIBRARY, MINNEAPOLIS, MN.
THE BRITISH LIBRARY, LONDON, ENGLAND.
HARVARD LIBRARIES, CAMBRIDGE, MA.
DEGOYLER HISTORY OF SCIENCE LIBRARY, UNIVERSITY OF OKLAHOMA, NORMAN, OK.
LIBRARY OF CONGRESS, WASHINGTON, D.C.
LIBRARY OF THE NEW YORK MEDICAL ACADEMY, NEW YORK CITY, NY.
LIBRARY OF THE UNITED STATES GEOLOGICAL SURVEY, RESTON, VA.
LIBRARY OF THE UNIVERSITY OF CALIFORNIA, LOS ANGELES, CA.
THE RICHARD T. LIDDICOAT LIBRARY, GEMOLOGICAL INSTITUTE OF AMERICA, CARLSBAD, CA.
THE NEW YORK PUBLIC LIBRARY, NEW YORK CITY, NY.
THE NATIONAL LIBRARY OF MEDICINE, BETHESDA, MA.
THE SMITHSONIAN INSTITUTION LIBRARIES, WASHINGTON, D.C.
STANFORD UNIVERSITY LIBRARY, STANFORD, CA.
TUCSON PUBLIC LIBRARY, TUCSON, AZ.
UNIVERSITY OF ARIZONA LIBRARY, TUCSON, AZ.
UNIVERSITY OF ILLINOIS LIBRARY, CHAMPAIGN, IL.

Finally, the compiler's thanks goes out to all the collectors, librarians and bibliophiles who provided comments and guidance on previous issues of the *Biobibliography* and continue to help shape this project.

Introduction

This work, *Mineralogy & Crystallography: a Biobibliography*, describes the lives and books of many researchers that are important to the development of these two sciences. It includes information on works published through December, 1919. This terminal date was chosen because of its particular significance in the development of the sciences with regard to the spreading use of X-ray diffraction techniques after World War I and the disinterest of the compiler in nearly all mineralogical books published after this date. The works listed therefore, were first issued between the earliest item described, Pliny's *Historia Naturalis* (1st ed., Venice, 1469), and December 31, 1919—a span of 450 years. Modern reprints of older titles first issued during this period are also listed. In a few instances the compiler has an appreciation for a work first published after the terminal date, and its description has been included for his own amusement.

Headings of Entries

This is essentially an author catalog with biographical commentary and references heading an annotated bibliography of the authors mineralogic and crystallographic books. The cataloging procedure followed is based on that of the Anglo-American Cataloguing Rules (AACR2)^[1] with minor modifications referred to below.

Personal names. The principle of using for the heading the most widely used form of the name has been followed, but (a) medieval names containing a forename are entered under the forename, e.g. ALBERTUS MAGNUS, not

MAGNUS, ALBERTUS; (b) Latin or Greek forms if commonly used are preferred to the vernacular, e.g. AGRICOLA, GEORGIUS, not BAUER, GEORG; (c) Westernized forms are used for Arabic or other Oriental writers, e.g. AVICENNA not IBN SĪNA, ABŪ 'ALĪ AL-ḤUSAYN IBN 'ABDALLĀH. Noblemen are entered under the title or family name, whichever is the better known. Contrary to Anglo-American Cataloguing Rules practice, names with unlauded vowels (ä, ë, ï, ö, ü and ÿ) are retained with the umlauts and inserted into the sequence as though spelt as 'a', 'e', 'i', 'o', 'u' and 'y'. For further information see ARRANGEMENT OF TITLES within this introduction.

Anonymous and pseudonymous works. Where a book was published anonymously, but the authorship is known it is entered under the name of the author. Occasionally, if a pseudonym is better known, it is listed under the pseudonym. All works attributed to a single author, whether acknowledged or not, are entered under the same main heading, i.e. anonymous and pseudonymous works are not separated from those in which the author's true name appears, as they are in the *British Library Catalogue* (BLC in the reference list). Where authorship is indicated only by unidentified initials, the last initial excluding any abbreviated designation such as M.D. is used for the heading. Works for which the author is unknown are listed under the first substantive words of the title.

Spurious works. Works falsely attributed to an author are arranged following the author's genuine works but under a separate heading consisting of the author's name preceded by the word 'Pseudo', e.g. PSEUDO ARISTOTLE. This does not apply to writings which are generally included in the corpus of an author's work but are of doubtful authenticity. These works are arranged under the main heading but with a

[1] M. Gorman and P.W. Winkler, *Anglo-American cataloguing rules*. Second edition. London, The Library Association, 1978. [i]-xvii, 1-620 p.

INTRODUCTION

distinctive subheading, e.g. SUPPOSITIOUS AND DOUBTFUL WORKS.

Dissertations. The Anglo-American Code is followed in preference to the standard adopted in the *British Library Catalogue*, i.e. the main entry for a dissertation is entered under the name of the 'Praesesidium' rather than that of the 'Respondent.' Cross-references are then provided from the 'Respondent' to the main entry of the Praesesidium through the name index.

Joint authors. The main entry for a work is entered under the senior author (usually listed first on the title page). Cross-references are then provided from all subsequent authors to this main entry. In a few cases when a work is known to be the result of a junior author's labor, the main entry is placed under the name of the junior author, and cross-references are provided from all other authors. For example, Brooke & Miller's *An Elementary Introduction to Mineralogy* (London, 1852) is listed under Miller's corpus based on information supplied by Brooke in the preface. A cross-reference to Miller is then supplied under Brooke's entry.

Corporate and group headings. In addition to the usual corporate headings (e.g. GEORGE ENGLISH & CO.), two special group headings are employed simply to bring together like material which would otherwise be difficult to trace in an author catalog, e.g. (a) CATALOGS OF MINERAL COLLECTIONS, a heading chosen for a class of items that effectively was the creation of the collector, who is usually not the author of the catalog. Cross-references are given to the full entry; (b) JOURNALS AND PERIODICALS, under which heading are listed the titles of all regularly published serials described in the bibliography, with cross-references to their main entry.

Cross-references. Reference is made from alternative forms of the name to the one adopted for the main heading. Names with prefixes are normally entered according to the Anglo-American Code, unless an exception is made because some alternative form appears to be more widely accepted. Cross-reference from the part(s) of name not used for entry is omitted, except where it can be used to clarify where in the sequence an author is

entered. References from Arabic forms are kept to a minimum because (a) the Westernized form which was commonly used in Renaissance Europe is familiar to Oriental scholars, and others are more likely to seek the writings of these authors immediately under the Western name; (b) the complexity of Arabic names makes cross-reference of little use unless it is done on a scale which is only practicable in a very large work such as that of the *British Library Catalogue*. Cross-references within the main body of the text have been kept to a minimum. However, the names of editors, translators, and others contributing in any form to a work, including printers and publishers may be found in the comprehensive name index provided at the end of the *Biobibliography*. For further information, see the section labeled INDEXES below.

Entry Description

Biography

The main entry consists of a name, either personal or corporate, or the first words of a work published anonymously.

Personal Names. If the main entry consists of a persons name (most common), the full name of the individual is provided, as much as possible in agreement with the standard biographies available to the compiler (see REFERENCES for a complete list). When discrepancies arose, national biographies pertinent to the individual's native-land took precedence for the correct spelling of the name. If the individual in question could not be located in any such biography(s), the spelling of the name as used by *The National Union Catalogue* (NUC in the reference list) took precedence, followed in turn by *The British Library Catalogue* and then the *Catalogue Général des Livres Imprimés de la Bibliothèque Nationale* (BLC and CBN respectively in the reference list). Cross-references from name variants were then established back to the main entry. The personal name is followed by the places and dates of birth and death enclosed in parentheses. The word BORN precedes information indicating birth data, while the term DEATH precedes death data. The nationality and occupation(s)

of the individual is then provided. A condensed biographical portrait of the person is then given, emphasizing various mineralogical aspects of the life. Listed at the end are citations to published obituaries and biographies where further biographical detail may be found. For the more famous of the researchers, these lists are not necessarily exhaustive. For example, there is a tremendous body of secondary literature concerning Linneaus and the citations listed in his biography, although numerous, are by no means complete. Within the references, notice is also given of published portraits and other likenesses of the author and comprehensive bibliographies covering the individual that have come to the compiler's attention.

Commercial Firms. If the main entry consists of the name of a commercial firm, the full name of the company is given. This is followed by information giving details, as much as they are known, of the firm's history and proprietors. At the end are listed references where further information may be researched.

Museums. If the main entry consists of the name of a museum, the city and country where the museum is located is given, followed by the full name of the museum. This is followed by details, as much as they can be ascertained, of the history of the body, including the date of founding. At the end are listed citations where further information may be researched.

Societies and Organizations. If the main entry consists of the name of a society or other organized body, the city and country where the society was organized is given. This is followed by the full name of the society or organization. This is followed by details, as much as they can be ascertained, of the history and membership of the society. At the end are listed citations where further information may be researched.

Anonymous Titles. If a work is listed that has an unknown author, the first substantive words of the title will be used to create its heading. No other information will be provided in the heading of the entry.

Bibliography

A listing of mineralogical and crystallographical books authored by the subject follows the

heading entry. The most important source for this section has of course been the close examination of the books themselves. For this the resources of several private and public libraries have been invaluable (see ACKNOWLEDGEMENTS for a list). The next best source for entries have been photocopies of the title pages of the various works, while the remainder of the entries were gathered from many general and specialized bibliographies as well as the internet and a large selection of bookseller catalogs.

Description of Bibliographical Entries

The most complete bibliographic entries are those where a copy of the listed title has been carefully examined, while less complete descriptions occur for those works not actually examined. The design of the bibliography was derived after reviewing hundreds of bibliographies on a wide variety of subjects. In addition, a relatively recent book on bibliography design helped avoid several pitfalls.^[2] The format chosen to describe the individual titles is a combination of the ideas presented in the bibliographic manuals of Bowers,^[3] Esdaile,^[4] Gaskell,^[5] and McKerrow.^[6] The most complete form of an entry consists of the following features.

Entry Number. Each title listed in the bibliography is given a unique number. These start at 1 and increment for each title listed through out the whole bibliography.

Language(s) and Year(s). Publication language and year in which the title appeared. Other

INTRODUCTION

editions and issues are usually listed as separate entries under the same author.

Edition and Translation Note. Following the Language(s) and Year(s) and enclosed in square brackets is a short note indicating either edition or translation information about the forthcoming title.

Title. The title as it was originally printed is given. If a copy of the title page has been examined it is represented in quasi-facsimile transcription as accurately as possible. Punctuation and accent marks have been reproduced as best as possible, as have special characters such as τ , φ , \mathfrak{Z} , \mathcal{O} , Γ , Θ , α , ϵ , γ , λ , and β . Spelling as it appears on the title page has been copied exactly. Vertical bars “|” indicate the end of a line within the title. Printed errors in the title are followed by a comment of the form [!]=mistake or [sic]=as written. Extraneous descriptions or comments relevant to the format of the title are enclosed in square brackets. Common examples include [short rule], [rule], [double rule], and [ornament].

Format. The pagination of the book(s) begins with reference to the predominant number of leaves in a single section. For example, 2°=folio, 4°=quarto, 8°=octavo, 12°=duccimo, etc. The format is ended by a colon “:”.

Collation. In older books it was common for the printer to add some mark on the various folded section of a book to facilitate the gathering of the signatures in correct order so they could be bound up. These marks were usually a number or a letter or a combination thereof. In this bibliography the gatherings are listed after the format. Following standard bibliographic practice, the Greek character Π p is used to indicate a book's preliminary unsigned leaves and the Greek character χ c indicates unsigned leaves within the body of the book. However, in difference from common practice the collations presented do not attempt to account for all pages of a signature. Rather the collations given account for pages in a book with printing on them.

Leave Count. After the collation, the absolute count of leaves is given. This is useful in determining if the collation matches the

pagination. For example, the collation provides a formulae of the leaf count, whose total if multiplied by 2 must equal the page count as given by the pagination. If they don't equate, a discrepancy exists in one or the other or both! For example, the collation p^2 a-c⁸ d³ says there are $2+8+8+8+3=29$ leaves contained in the book, which means there should be $29 \times 2 = 58$ pages.

Pagination. A short hand description of the numbering that occurs on the pages is given. Items enclosed in square brackets are assumed and do not actually appear on the page. If appropriate, descriptive material noting the number of plates, maps, tables, etc. will end the pagination of each volume.

Page Size. The size of the title page measured in millimeters is provided. Measurement is done first along the length of the page, then across the width. The length of the title is defined to be perpendicular to the reading direction of the text on the title page.

Contents. Each book is unique in the method the author and/or publisher has elected to order the information. The contents provides a description of this arrangement. However, it is not meant to be an exhaustive page by page account of the books information. Rather this is an overview of the major sections contained within the volume(s), with the beginning and ending pages indicated or in some cases the beginning and ending leaves. Descriptions enclosed in quotes are derived directly from the first page indicated, while those not in quotes are the compilers interpretation of the intended content. Any comments included by the compiler are enclosed in square brackets.

Plates, Tables and Maps. In some books where it is not possible to describe the illustrations depicted on the plates easily, a list of the individual or groups of plates will be provided. Maps and tables when they represent a substantial portion of the volume(s) will also be treated in a similar fashion.

Rarity. An attempt is given to provide an idea of the relative rarity of the title listed. This is subjective information based on a wide range of characteristics, such as the book's language, date of publication, frequency of listings in bookseller catalogs, and the collective holding

in public and private United States, British, and European libraries, etc. Several categories are provided to distinguish rarity, i.e. ONLY COPY KNOWN=only one copy traced, EXTREMELY RARE=2-5 copies traced, VERY RARE=6-12 copies traced, RARE=13-22 copies traced, VERY SCARCE=23-32 copies traced and SCARCE=more than 33 copies traced.

Commentary. The commentary describes the importance (if any) of the title to the history and development of mineralogy or crystallography. Inclusion may be made of a contents summary, quotations from the work, translation of the title, publishing history, descriptions of notable illustrations, etc.

Other Editions, Translations & Reprints. For books that went through many editions or were reprinted after 1919, this section will provide the pertinent information about the title. In addition, titles that have only minor mineralogical information, but had multiple editions or translations, will use this section to list other variations of the book. Usually, this consists of a short title, place of publication, year and pagination. Rarely, a full description with commentary will be provided.

References. If a particular title is important to the development of either science, other authors will most likely have written about the book, and its place in history. In addition, various library catalogs or bibliographies may include the title. Citations to these other writings will appear in this position. Reference to book reviews is also given here. If no reference to the described title has been found, REFERENCES will not appear at the end of the commentary.

Arrangement of Titles

The headings in the *Biobibliography* are in a single alphabetical order and consist primarily of the names of the authors of the various works. Headings such as those used for anonymous works, periodicals, journals, official institutions, museums, mineral collectors, dealers, societies, or other national bodies are included in the same alphabetical sequence. Frequent use is made of cross references when a particular entry could be searched for under different headings.

Roman Alphabets

Names originally written in a Roman alphabet language retain all diacritical marks and special characters as they would if written in their native language. To simplify the location of a particular name, all accented characters fall into the same alphabetical sequence as if they were not accented. Thus á=a, ç=c, ê=e, í=i, ô=o, ò=o, ū=u, etc. Contrary to Anglo-American Cataloguing Rules practice, there is no exception to this rule for the unlauded vowels, ä, ë, ï, ö, ü and ÿ. When one or more of these characters appears in a name, each occurrence of the vowel is treated in the alphabetical sequence as though it is a normal letter. Thus, ä=a, ë=e, ï=i, ö=o, ü=u and ÿ=y.

The old use of a superscripted “e” above a letter to indicate an unlauded vowel has been retrained in the title transcriptions. Thus for transcription to a modern convention, â=ä, ê=ë, ô=ö, ū=ü and ÿ=ÿ.

TABLE 1

Non-Roman Alphabets

Names originally written in the Russian, Belorussian or Bulgarian languages and utilizing the Cyrillic alphabet have been transliterated to the roman alphabet. There are a number of tables available for the purpose of

INTRODUCTION

transliteration, and the one chosen for the *Biobibliography* is also used by the Library of Congress for transliterating Russian with diacritical marks.^[7] A representation of the transliteration table used within the *Biobibliography* is presented in Table 1.

In addition, there are certain letter combinations, usually occurring at the end of a Russian word, that convert to specific sequences in English. For this purpose specific conversions were used (see Table 2).

CYRILLIC	ENGLISH
-ый	-yĭ
-ий	-iĭ
-ия	-iĭa
-ье	-'e
-ьи	-'i
-кс	-ks

TABLE 2

Order under the Main Heading

For individual works and collections (including analytical entries) the order is chronological by date of publication (entries of the same date being arranged alphabetically by title), but all versions of the same work or collection are grouped together. Such groups are arranged by language, the order of languages being chronological by date of publication of the earliest entry in each. Under each language the arrangement is (a) original editions, if more than one, in chronological order; (b) translations, if more than one, in chronological order; (c) editions of the same language in chronological order; (d) specific cross-references in alphabetical order. See Figure 1 for a diagram of the general scheme.

Within entries, general cross-references are arranged in alphabetical order, but multiple references to a single heading main entry are condensed to a single cross-reference. In a few cases where a very substantial number of entries appear under a single heading, such as under PLINY, titles are grouped in a special way, usually according to the order adopted in the standard editions of the complete works of

the author. A summary of the arrangement will be found at the beginning of each of these groups. There are also a few cases where minor variations occur, these are indicated by subheadings within the body of the entry.

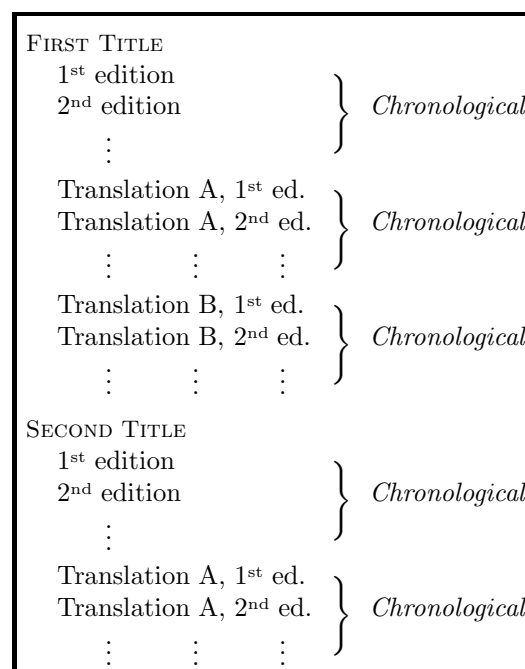

FIGURE 1: General Ordering of Titles

Indexes (not implemented)

To facilitate the use of this *Biobibliography*, a series of comprehensive indexes has been provided at the end. In order to make maximum use of the index, when a citation refers to a bibliographic title entry, reference is back to the titles entry number in the list. In the case of references back to a main biographical entry, the page number, rather than an item number is used in the index. The page number is distinguished from an item numeral by the application of a bold font. The individual indexes are described below.

Indexes of Towns and Printers. These list under each country the various places of publication and the names of the printers and publishers. It is hoped that these very extensive indexes will prove a useful contribution to the study of

[7] J.T. Shaw, *The transliteration of modern Russian for English language publications*. Madison, Univ. of Wisconsin Press, 1967.

printing and mineralogical publishing from the fifteenth to the early twentieth century.

Index to Anonymous Works. When a work published anonymously can be attributed to a known author, it has been entered in that authors bibliography. However, a collector, bookseller or librarian, actually examining the work may not know the actual author. Therefore this index of short titles with references to the main entry is provided to facilitate their lookup.

Name Index. This is a comprehensive index to all names mentioned throughout the body of the *Biobibliography*. The names are listed in a single alphabetical sequence with cross-references from name variants included. Authors, translators, contributors, editors, printers, publishers, artists, engravers and other incidental names are listed in a single sequence, with reference to the page or entry where mention is made.

Subject Index. This is an index to subjects mentioned throughout the body of the *Biobibliography*.

The Jewish encyclopedia; a descriptive record of the history, religion, literature, and customs of the Jewish people from the earliest times to the present day. Compiled by Isidore Singer and Cyrus Adler. New York, London, Funk & Wagnalls Company, 1901-06. 12 vols.

Jöcher, Gelehrten-Lexikon, 1750-51

Jöcher, C.G., *Allgemeines Gelehrten-Lexikon darinne die Gelehrten aller Stände sowohl männ- als weiblichen Geschlechts, welche vom Anfange der Welt bis auf ieszige Zeit gelebt, und sich der gelehrten Welt bekannt gemacht nach ihrer Geburt, Leben, merckwürdigen Geschichten, Absterben und Schrifften aus den glaubwürdigsten Scribenten in alphabetischer Ordnung beschrieben werden*. Leipzig, J.F. Gleditsch, 1750-1. 4 vols. [Reprinted, Hildesheim, G. Olms, 1960-1. An important, early biographical dictionary.].

Jöcher, Gelehrten-Lexikon, Supplement

Jöcher, C.G., *Fortsetzung und Ergänzungen zu Christian Gottlieb Jöchers allgemeinem Gelehrten-Lexicon, worin die Schriftsteller aller Stände nach ihren vornehmsten Lebensumständen und Schrifften beschrieben werden von Johann Christoph Adelung und vom Buchstaben fortgesetzt von Heinrich Wilhelm Rotermond*. Leipzig, 1784-1897. 7 vols. [Reprinted, Hildesheim, G. Olms, 1960-1. Continuation of Jöcher's *Allgemeines Gelehrten-Lexikon* through supplemental volumes, numbered 1 to 7.].

Johannsen, Descriptive Petrography, 1939

Johannsen, A., *A descriptive petrography of the igneous rocks*. Chicago, Ill., 1939. 4 vols. [i]-xxiv, [1]-318 p.; [i]-xxxi, [1]-421 p.; [i]-xiv, [1]-360 p.; [i]-xvii, [1]-523 p. [Contains much historical information on the rise of petrology as a science.].

Johnston-Lavis, Bibliography of Volcanoes, 1918

Johnston-Lavis, H.J., *Bibliography of the geology and eruptive phenomena of the more important volcanoes of southern Italy*. Second edition completed after the author's death by Miss B.M. Stanton and edited with a preface and short life of the author by B.B. Woodward. London, The University of London Press, Ltd., 1918. [i]-xxi, [3], [1]-373, [3] p., frontispiece (portrait). [The author was professor of vulcanology in the Royal University of Naples.].

Jutting, History of Conchological Collections, 1939

Jutting, W.S.S. van B., "A brief history of the conchological collections at the Zoological Museum of Amsterdam, with some reflections on the eighteenth-century shell cabinets and their proprietors, on the occasion of the centenary of the Royal Zoological Society 'Natura A'," *Bijdragen tot*

- de Dierkunde, **27** (1939), 167-246.
- Katalog Bergakademie Freiberg, 1879**
Katalog der Bibliothek der Königlich Sächsischen Bergakademie Freiberg. Teil 1: Alphabetischer Katalog. Freiberg, 1879. [6], [1]-766 p. [First printed catalogue of the library of Bergakademie Freiberg. This volume lists 17,836 books with author, title, place and date. For further detail, see entry in main work.]
- Kelker, History of Liquid Crystals, 1988**
 Kelker, H., "Survey of the early history of liquid crystals," *Molecular Crystals*, **165** (1988), 1-43. [Contains information on the early history of liquid crystals especially Otto Lehmann.]
- Kelley & Burrage, American Medical Biography, 1928**
 Kelley, H.A. and W.L. Burrage, eds., *Dictionary of American medical biography.* New York, D. Appleton and Co., 1928. [i]-xxx, [1]-1,364 p. [Supplemented and largely replaced by *Dictionary of American Medical Biography*, 1984].
- Kestner, Medicinisches Gelehrten-Lexicon, 1740**
 Kestner, C.W., *Medicinisches Gelehrten-Lexicon, darinnen die Leben der berühmtesten Aerzte, samt deren wichtigsten Schrifften, sonderbaresten Entdeckungen und merckwürdigsten Streitigkeiten aus den besten Scribenten in möglichster Kürze nach alphabetischer Ordnung beschrieben.* Nebst einer Vorrede G. Stollens. Jena, Meyer, 1740. [16], [1]-940, [4] p. [Reprinted, Hildesheim, New York, Olms Verlag, 1971; Biographies of famous physicians, with notes on their writings and discoveries.]
- Keyes, A Century of Iowa Geology, 1920**
 Keyes, C.R., "A century of Iowa geology," *Iowa Academy of Sciences, Proceedings*, **26** (1920), p. 407-440, 13 plates.
- Keynes, Bibliography of Dr. Robert Hooke, 1960**
 Keynes, G.L., *Bibliography of Dr. Robert Hooke.* Oxford, 1960. [i]-xix, [5], [1]-115 p., 12 plates, 11 facsimiles of title-pages.
- Keynes, Bibliography of Sir Thomas Browne, 1968**
 Keynes, G., *Bibliography of Sir Thomas Browne*, Second edition, revised and augmented. Oxford, 1968. iii-xv, [1]-293 p., 4 plates, illus., facsim., ports. [ISBN 0198181302].
- Keynes, John Ray, a Bibliography, 1951**
 Keynes, G.L., *The bibliography of John Ray.* London, Faber and Faber, 1951. [i]-xvi, [1]-164 p., 4 collotype plates, 16 facsimiles of title-pages. Printed on tinted green paper.
- Khabakov, Ocherki Istorii Geolog Znanii v Rossii, 1950**
 Khabakov, Aleksandr Vasil'evich., Очерки по истории геолого-разведочных знания в России [Ocherki po istorii geologo-razvedochnykh znanii v Rossii] (materialy dlia istorii geologii). Moskva, Izd-vo Moskovskogo obshchestva ispytatelei prirody, 1950. 212 p., illus. [Descriptions and history of various geological surveys in Russia.; Series, *Istoricheskaja Seriya Moskovskoe obshchestvo ispytatelei prirody*, no. 40.]
- Kilgour Collection of Russian Literature**
The Kilgour collection of Russian literature, 1750-1920 with notes on early books and manuscripts of the 16th and 17th centuries. Cambridge, Mass., Harvard College Library; distributed by the Harvard University Press, 1959. [583] p., plates, illus. [Catalog of a large library of Russian literature that was subsequently acquired by Harvard University.]
- Kitson, Lapidary Traditions in England, 1978**
 Kitson, P., "Lapidary Traditions in Anglo-Saxon England: Part 1, the background," *Anglo-Saxon England*, **7** (1978), 9-60; and *ibid.*, "Lapidary traditions in Anglo-Saxon England: Part II, Bede's 'Explanatio Apocalypsis' and related works," *Anglo-Saxon England*, **12** (1983), 73-123.
- Klebs, Incunabula Scientifica, 1938**
 Klebs, A.C., "Incunabula scientifica et medica," *Osiris*, **4** (1938), no. 1, 1-359. [Short title listing of over 3,000 incunabula related to science and medicine.]
- Klebs, Herbals of the Fifteenth Century, 1917-8**
 Klebs, A.C., "Herbals of the fifteenth century. Incunabula lists I," *Papers of the Bibliographical Society of America*, **11** (1917), nos. 3-4, 75-92 & **12** (1918), nos. 1-2, 41-57. [Gart der Gesundheit, pp. 42-48; Hortus Sanitatis, pp. 48-51.]
- Klebs, Catalogue of Early Herbals, 1925**
 Becher, K., *A catalogue of early herbals.* Mostly from the well-known library of Dr. Karl Becher, Karlsbad with an Introduction by Dr. A. Klebs. Nyon Bulletin XII. Lugano, L'Art Ancien S.A., 1925. [1]-61 p., illus. [Bookseller catalog describing the extensive collection of early herbals formed by Dr. Becher.]
- Klemm, Geschichte der Sammlungen, 1837**
 Klemm, G., *Zur Geschichte der Sammlungen für Wissenschaft und Kunst in Deutschland.* Zweite, mit einem ausführlichen Inhaltsverzeichnis. Zerbst, Kummer, 1837. [i]-xvi, [1]-328 p. [History of scientific and art collecting in Germany.]
- Knight, Natural Science Books in English, 1972**
 Knight, D.M., *Natural science books in English, 1600-1900.* New York & Washington, Praeger Publishers, 1972. [i]-x, [1]-262 p., illus., index.
- Knoll, Österreichische Naturforscher, 1957**
 Knoll, F., *Österreichische Naturforscher, Ärzte und Techniker.* Herausgegeben im Auftrage der Österreichischen Akademie der Wissenschaften. Wien, 1957. [1]-238 p., 98 illus. [Biographical portraits of Austrian naturalists, doctors and engineers.]
- Kobell, Geschichte der Mineralogie, 1864**
 Kobell, F.v., *Geschichte der Mineralogie. Von 1650-1860.* München, 1864. [i]-xiv, [1]-703 p., illus. [History of mineralogy from 1650 to 1860. For further detail, see entry in main work.]
- Kobell, Die Mineral-Namen, 1853**
 Kobell, Franz von. *Die Mineral-Namen und die Mineralogische Nomenklatur.* München, J.G.

Kristeller, P., *Italienische Buchdruckerzeichen und Verlegerzeichen bis 1525*. Berlin, 1893. [i]-xiv, [1]-143, [2] p. [Contains 351 reproductions of early Italian printers' marks with biographical sketches of the printers.].
- Kristeller, Kupferstich und Holzschnitt, 1921**
Kristeller, P., *Kupferstich und Holzschnitt in vier Jahrhunderten*. Berlin, Bruno Cassirer, 1921. [i]-x, [1]-601, [3] p. [Contains 263 illustrations in the text. Study of woodengraving and copper engraving over four centuries.].

Kunz & Stevenson, Book of the Pearl, 1908

Kunz, George F. and C.H. Stevenson, *The book of the pearl. The history, art, science, and industry of the queen of gems.* New York, The Century Co., 1908. [i]-xix, [1]-548 p., color frontispiece, illus. (incl. maps), plates (part colored, part fold.), portraits.

Kunz, Curious Lore of Precious Stones, 1913

Kunz, George F., *Curious lore of precious stones. Being a description of their sentiments and folk lore, superstitions, symbolism, mysticism, use in medicine, protection, prevention, religion, and divination.* Philadelphia, J.B. Lippincott Co., 1913. [1]-406 p., illus.

Kunz, Magic of Jewels and Charms, 1915

Kunz, George F., *The magic of jewels and charms.* Philadelphia, J.B. Lippincott Co., 1915. [1]-422 p., illus.

Kunz, Rings for the Finger, 1917

Kunz, George F., *Rings for the finger from the earliest known times to the present, with full descriptions of the origin, early making, materials, the archaeology, history, for affection, for love, for engagement, for wedding, commemorative, mourning, etc.* Philadelphia, J.B. Lippincott Co., 1917. [i]-xviii, [1]-381, [3] p., 3 color plates, 54 half-tone plates, one folding facsimile. [The largest single storehouse of information on finger rings available in any language.].

Kunz, Shakespeare and Precious Stones, 1916

Kunz, George F., *Shakespeare and precious stones, treating of the known references of precious stones in Shakespeare's works, of his material, the knowledge of the poet concerning precious stones, and references as to where the precious stones of his time came from.* Philadelphia, J.B. Lippincott Co., 1916. [1]-110 p.

Kuznetsov, Liudi Russkoi Nauki, 1961-5

Kuznetsov, Ivan V., ed., *Лиуди русской науки. Очерки о выдающихся деятелях естествознания и техники* [Liudi russkoi nauki. Ocherki o vydaushchikhsia deiateliakh estestvoznaniia i tekhniki]. Moscow, Fizmatgiz, 1961-5. 4 vols. [A biographical dictionary of Russian scientists, with sections in the volumes devoted to specific fields, such as geology, geography, biology, medicine, natural history, mathematics, chemistry, mechanics, astronomy, physics, and technology.].

La Rocque, History of Geology, 1964

La Rocque, A., ed., *Contributions to the history of geology.* Columbus, Ohio, Ohio State University, Department of Geology, 1964-82. 3 vols., irregular pagination. [Consists of a biographical dictionary of geologists, an index to biographical sources for geologists, and a bibliography of references to the history of geology.].

Lacroix, Figures des Savants, 1932-8

Lacroix, Alfred., *Figures des savants.* Paris, 1932-8. 4 vols. [A biographical collection, mostly of French geologists and mineralogists, with portraits

and manuscript examples. A remarkable reference.].

Laehr, Literatur der Psychiatrie, 1900

Laehr, H., *Die Literatur der Psychiatrie, Neurologie und Psychologie von 1459-1799.* Berlin, G. Reimer, 1900. 3 vols. [1]-751 p.; [1]-1,131 p.; [1]-271 p. [Bibliography of the literature of psychiatry, neurologie and psychology, 1459-1799.].

Laissus, Cabinets d'Histoire Naturelle, 1964

Laissus, Y., "Les cabinets d'histoire naturelle" (pp. 659-712), in: R. Taton, ed., *Enseignement et diffusion des sciences en France au XVIIIe siècle.* Paris, Hermann, [1964].

Laitakari, Geologische Bibliographie Finnlands, 1934

Laitakari, Aarne., *Geologische Bibliographie Finnlands, 1555-1933.* [1]-223 p. [Published as: *Bulletin de la Commission Géologique de Finlande*, 108 (1934). [Bibliography of Finnish geology, 1555 to 1933.].

Lambrecht & Quenstedt, Catalogus, 1938

PEDER ABILDGAARD

ABILDGAARD, Peder Christian. (BORN: Copenhagen, Denmark, 22 December 1740; DIED: Copenhagen, Denmark, 11 January 1801) *Danish physician & naturalist.*

Abildgaard was the son of Søren [see next entry]. He was educated at the Veterinarian School in Lyon. He authored many works on medicine, zoology, etc., and gave in 1796 a description of the *Megatherium* at the same time as Georges Cuvier. Abildgaard was a secretary of the Academy of Sciences, Copenhagen, and he founded and directed the Veterinary School of Copenhagen. In mineralogy he was the first to examine and report on the mineral species Cryolite found in Greenland.

1. — German, 1801 [First separate issue].

Ueber Norwegische Titanerze und eine neue Steinart (Kryolith) aus Grönland, welche aus Flusspathsäure und Alaunerde besteht. Aus dem Dänischen übersetzt von Moritz Heinrich Mendel. Copenhagen, 1801.

8°: 10 p.

VERY RARE. First separate appearance in German translation by Moritz Heinrich Mendel [see note below] of the article "Om Norske Titanertser och om en

nye Steenart Kryolith fra Grønland, som bestaar af Flusspatsyre og Alunjord" (see: *Videnskabernes Selskabs Skrifter* (Danske), 3 (1800), 305-316). The text describes two mineral species: (1) sphene crystals found in Norway, and (2) the new mineral species cryolite found in Ivigtut, Greenland. Abildgaard was the first researcher to examine the mineral samples brought back from Greenland by Andrade and named the new species he discovered Kryolith or Iissteen (from the Greek κρυος meaning ice). Abildgaard performed chemical analysis of the minerals and found that cryolite contained aluminum and hydrofluoric acid.

Moritz Heinrich Mendel. (BORN: Breslau, Germany, 1777; DIED: Breslau, Germany, 3 December 1813) *German physician.* Mendel received his medical degree in 1811, and he was named professor of the new University in Breslau. He became director of the cities medical clinic and was named an advisor on medical subjects. However, his life was cut short when while fighting an outbreak of typhus, he contracted the disease.

SØREN ABILDGAARD

ABILDGAARD, Søren. (BORN: Flekkefjord, Denmark [now Norway], 18 February 1718; DIED: Copenhagen, Denmark, 2 July 1791) *Danish draughtsman, mineralogist & naturalist.*

Abildgaard matriculated at the University in Copenhagen in 1737 and became interested in the natural

ABILDGAARD

sciences and particularly in its practical application. After he left school, Abildgaard supported himself through his capabilities as an expert draftsman and painter. Over 900 of his drawings are preserved in Danish museums.

BESKRIVELSE, 1759

2. — Danish, 1759 [First edition].

Søren Abildgaards | Beskrivelse | over | Stevens Klint | og | dens naturlige | Mærkværdigheder, | oplyst og udført med | Mineralogiske og Chymiske | Betragtninger, | samt forsyned med fornødne Kobberstykker. | [rule] Imprimatur, B. Möllmann. | [ornate rule] | København, 1759. | trykt hos L.N. Svare, boende i Skindergaden.

8°: π^3 A-C⁸ χ^1 ; 28 ℓ .; [6], [1]-50 p., 3 folding plates. PAGE SIZE: 225 x 170 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [4 pgs], Dedication, signed Søren Abildgaard, 31 March 1759.; [1]-50, Text.; [At end], 3 plates.

VERY SCARCE. A visit to the chert and fossil bearing chalk beds of Stevn Klint situated south of Copenhagen along Denmark's Baltic coast prompted Abildgaard to write in 1759 the first geological account of this interesting formation. Dedicating the book to King Frederick the Fifth, a description of the area is provided, including mineralogical and chemical

observations on the chert nodules, fossil shells and the surrounding material. Abildgaard speculates that the chert is actually petrified soil. At the end of the volume are bound three plates engraved from the author's original drawings that show panoramas of the beds and on plate 3, various fossil shells found in the strata. Abildgaard also indicates he plans to write another book describing a similar formation in Møns, which was published as *Physisk-Mineralogisk Beskrivelse over Moens Klint* (København, 1781) [which see entry below].

Modern geochemical research on specimens from Stevn Klint, a famous and classic formation, show that at the Cretaceous-Tertiary boundary, there is a high saturation of iridium and gold. This together with the presence of meteoric proportions of other metals provides further evidence of an asteroidal impact in the earth's distant past.

ACCUM, Friedrich Christian. (BORN: Bückeburg, Saxony, Germany, 29 March 1769; DIED: Berlin, Germany, 28 June 1838) *German chemist & mineralogist.*

In 1793, Accum moved to London, where in 1800, he established a laboratory and laboratory supply business. He became the scientific lecturer at the Surrey Institute in 1803, and was hired as an advocate for the use of gas in lighting. Through this connection, he became a "practical chemist" for the London Gaslight Company in 1812. A position as librarian for the Royal Institution proved to be

ACCUM

a disaster when his enemies accused him of damaging the books. This made Accum an outcast in London scientific circles, and as a result he had to reestablish himself in Berlin in 1822. From 1822 to 1838 he was a professor at the Gewerbe-Institute in Berlin. Accum held membership in the Royal Irish Academy, the Linnean Society of London and the Royal Academy of Sciences, Berlin.

PRACTICAL ESSAY, 1804

MANUAL, 1808

(p. 16, "Portable Universal Furnace"), title page figure of chemical apparatus. PAGE SIZE: 174 x 100 mm.

CONTENTS: [i-ii], Blanks.; [iii-iv], Title page, verso printer notice.; [v]-vi, "Preface."; [vii], "Errata."; [viii], Blank.; [i]-xvi, "Table of Contents."; [1]-183, Text.; [i]-vi, "Chemical Demonstrations or Private Lectures on Practical Chemistry."; vii-ix, "A List of Chemical Preparations."

SCARCE. This is a popular-style textbook describing the techniques used in the chemical determination of minerals. The preface gives the impression that the book was available only to pupils attending Accum's lectures, including the Americans Benjamin Silliman and William Peck; however, it appears to be common for this to be true. After a short description of the apparatus and general technique of mineral analysis, the first part of the book briefly describes the methods for analyzing the ores of twenty-two metals. The second part of the treatise is devoted to the analysis of the so-called earths, which in reality are natural oxide compounds of silica, aluminum, calcium, magnesium, strontium, barium, etc. This section also contains an interesting chemical examination of various soils. Part three discusses the analysis of mineral salts and the fourth part the examination of inflammable fossils or coal.

SCARCE. This greatly enlarged book is a second edition of *A Practical Essay on the Analysis of Minerals* (London, 1804). Written in the author's eloquent and comfortable style, this work appeared in an era when mineralogical pursuits were a popular pastime throughout the British Isles, and this book no doubt helped cultivate that popularity.

The book begins with a dedication to RICHARD KIRWAN the great Irish mineralogist who by 1808 had probably ceased any activity in mineralogy. The preface then describes Accum's surprise at having the first edition sell out in 18 months. This of course spurred the preparation of this new edition. It has been completely rewritten and greatly enlarged by the inclusion of long quotations from MARTIN HEINRICH KLAPROTH's *Analytical Essays* (English trans., London, 1801-4) and the writings of other mineralogists and chemists. In fact, fully half of the text of the present volumes are the product of other authors that are liberally quoted to illustrate principles developed by Accum.

The book is arranged along the lines of the former edition. It contains concise descriptions for the analysis of metallic ores, earths, stones and other minerals. Numerous detailed instructions help guide beginners through mineralogical analysis. The following text is divided into six parts. The first provides a general introduction to mineralogy, including definitions, descriptions of mineral substances, reagents and necessary equipment. Broad views of the mineralogical classifications of Werner and Haüy are then given. Included are table representations based upon two broadsides outlining these classifications methods that had been published about 1805. Accum's use of these earlier publications perhaps point to him as their anonymous author. Part two describes the tests and procedures necessary for analyzing minerals for any of the 25 metals then known. Part three, which opens volume two, describes the analysis of earths and stones. Part four describes the process for analyzing mineral and native salts. Part five describes the same for inflammable fossils, while part six covers mineral waters. The work concludes with a description of the two plates.

ELEMENTS OF CRYSTALLOGRAPHY, 1813

Elements | of | Crystallography, | after the Method of Haüy; | with, or without, | Series of Geometrical Models, | both Solid and Dissected; | Exhibiting the Forms of Crystals, their Geometrical | Structure, Dissections, and General Laws. | According to which the | Immense Variety of Actually Existing Crystals | are Produced. | [double rule] | By Frederick Accum, | Operative Chemist, | Lecturer on Practical Chemistry, on Mineralogy, and on Chemistry | applied to the Arts and Manufactures; Member of the Royal | Irish Academy, Fellow of the Linnæan Society, &c. | [tapered rule] | With Copper Plates. | [double rule] | London: | Printed for Longman, Hurst, Rees, Orme, and Brown, | Paternoster-Row. | [rule] | 1813.

8°: [a]⁷ b-z⁸ Aa-Bb⁸ Cc⁴ Dd²; 205ℓ.; [i]-lxiii, [1], [1]-396 p., frontispiece, 3 folding plates. PAGE SIZE: 212 x 127 mm.

CONTENTS: [i-ii], Half title page, "Accum's | Elements of Crystallography; | with or without | Series Of Geometrical Models, | and | With Plates And Wood-Cuts," verso blank; [Frontispiece]; [iii-iv], Title page, verso blank; [v]-vi, Dedication to Earl Percy, Count Münster Meinhovel, Sir John Borlase Warren and Sir John Saunders Sebright.; [vii]-xv, "Preface."; [xvi], Instructions to the binder.; [xvii]-xli, "Contents."; [xlii], Blank.; [xliii]-lii, "List of Crystallographic Models, both solid and dissected referred to in this work."; lii-lxiii, "Models Illustrative of Crystallography."; [1 pg],

ACCUM

"Notice."—dated 14 March 1813.; [1]-391, Text.; [392]-396, "Mineralogical Chests, Chemical Preparations and Apparatus manufactured and sold by Accum and Garden, Operative Chemists."; [At end], 3 folding plates.

PLATES: The 4 plates, numbered Pl. I to Plate IV, are all signed Lowry sculp. At the top of each is the description, "Accum's Crystallography." No information about the illustration appears on the plates themselves. Pl. I. (frontispiece), Dissected scalenohedron of Haüy. Pl. II., Basic crystallographic shapes (9 figs., folding plate). Pl. III., Dissected octahedron and pyritahedron of Haüy (2 figs.). Plate IV., Wollaston reflecting goniometer.

SCARCE. The first independent textbook published in English to describe the crystallographic theories of RENÉ JUST HAÜY. The work is dedicated to Earl Percy, Count Münster Meinhovel, Sir John Borlase Warren and Sir John Saunders Sebright who were among the students Accum taught. The text describes in detail Haüy's ideas on crystallography. In 1784, Haüy had first published his ideas in the *Essai d'une Théorie sur la Structure des Crystaux* (Paris, 1784). In this work, Haüy brought together the advances in crystallography made by Romé de l'Isle, Bergman and others into a coherent structural theory, based upon the idea of a microscopic "molecule integrante." This polyhedral unit contained all the elements of the macro crystal, and Haüy's model depicted crystals as built up out of these molecular units. Haüy also theorized a common "nucleus" or "primitive form" for all crystals of the same mineral species. This primitive form was thought to be revealed by cleavage of a crystal symmetrically along its angles and edges. Haüy's theory of crystal structure changed little in its essentials during the remainder of his career, and it is that theory that Accum describes in this work. The text is illustrated with diagrams and four plates which help describe principles outlined in the text. Ever the businessman, Accum also includes at the end an interesting sales catalog describing a wide variety of mineralogical apparatus, including various crystal models that Accum stocked in his Soho shop.

11. — English, 1812 [First edition].

Descriptive catalogue of the apparatus and instruments employed in experimental and operative chemistry, in analytical mineralogy, and in the pursuits of the recent discoveries of electro-chemical science ... Manufactured and sold by Accum and Garden, operative chemists ... [By Friedrich Christian Accum.] London, W. Hayden, printer, 1812.

8°: [2], 59, [1] p., 16 plates.

VERY SCARCE. Accum was one of the premier suppliers of chemical and mineralogical apparatus in London during the first decades of the nineteenth century. This trade catalog of the apparatus, chemicals, etc that were sold by the firm of Accum and Garden. There are described and listed 328 pieces of apparatus and 340 chemicals.

12. Another issue, 1816: Descriptive | Catalogue | Of The | Apparatus & Instruments | Employed In | Experimental And Operative | Chemistry, | In Analytical Mineralogy, | And In The | Pursuits Of The Recent Discoveries | Of | The Recent Discoveries | Of | Voltaic Electricity. | [short rule] | Manufactured And Sold | By Accum And Garden, | Operative Chemists, | Compton Street, Soho, London. | [short rule] | 1816.

8°: π¹ B-F⁶; 31ℓ.; [2], [1]-59, [1] p. COLOPHON: (p. 59) London:—Printed by G. Hayden, printer. PAGE SIZE: 192 x 116 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [1]-43, "Chemical | Apparatus And Instrumts."; 44-47, "Chemical Chests."; 48-50, "Chemical Preparations | For Philosophical Amusement."; 51-54a, "Chemical Preparations | Employed | In Philosophical Chemistry, In | Mineralogy, &c."; 54b-59, "Directions | For | Fitting Up A Laboratory ..."; [1 pg], Publisher's list.

VERY SCARCE. This edition was appended at the end of the author's *Practical Essay on Chemical Re-Agents* (London, 1816), and lists blow-pipes, balance, voltaic piles, diamonds, test papers, and many and various chemical compounds for sale by Accum and Gardner.

8°: A-B⁸ C⁷; 23ℓ.; [1]-45, [1] p.

VERY RARE. It is known that in 1808 or 1809 Accum circulated a one page advertisement, "Lectures on practical chemistry and analytical mineralogy, announcement of annual courses." The present work is the syllabus to these lectures. It was enlarged and reprinted in 1810 under the title, *Manual of a Course of Lectures on Experimental Chemistry and Mineralogy* (London, 1810).

REFERENCES: BL: [T.255.(4.)].

14. — English, 1810.

Manual | Of | A Course Of Lectures | On | Experimental Chemistry, | And On | Mineralogy; | Containing In The Form Of Axioms And Concise Outlines | The Elements And Fundamental Truths Of Chemical And | Mineralogical Science. | Intended To Illustrate | The Lectures delivered on these Branches of Knowledge in | The Theatre | Of | The Surry Institution, | [tapered rule] | With An Account Of The Action Of | Chemical Tests

| And Modes Of Applying Them In The Practice Of The Science. | [tapered rule] | By Fredrick Accum, | Operative Chemist. | [...5 lines of titles and memberships...] | [double rule] | London: | Printed by G. Hayden, 4, Brydges Street, Covent Garden; | And Sold By G. Kearsley, Fleet Street; And J. Callow, | Crown Court, Princes Street, Soho. | 1810.

12°: iv, 190, 28 p.

VERY RARE. In 1809, Accum prepared *Analysis of a Course of Lectures on Mineralogy* for a series of courses he was preparing to present in 1810. The described title is the textbook used during the course. It appears to be an expanded version of the aforementioned *Analysis* with more detail and wide margins for students to scribble notes.

15. — English, c1800.

Synopsis of the Mineral Kingdom, according to the methodical distribution of the Abbé Haüy. London, c1800.

Broadside.

RARE. Accum in the second edition of his *Analytical Mineralogy* (2 vols., London, 1808) makes use of this work to prepare his own table of the distribution of the mineral kingdom. This broadside was probably prepared by Accum.

ACHARD

ACHARD, Franz Carl. (BORN: Berlin, Germany, 28 April 1753; DIED: Kunern near Breslau, Silesia, Germany, 20 April 1821) *German chemist.*

Achard was hired as an aide to Andreas Sigismund Marggraf [1709-1782] at the Academy of Sciences, Berlin in 1776. After showing his merit as a chemist, he was appointed director of the "Class of Physics" at the Academy in 1782. Achard developed a commercial process to extract sugar from beets, and his essays on the process greatly contributed to promote the manufacturer throughout Europe especially Germany and France. He held membership in many learned bodies, including the Royal Academy of Sciences at Berlin to which he was elected in 1776.

BESTIMMUNG DER BESTANDTHEILE, 1779

ACHIARDI

16. — German, 1779 [First edition].

Bestimmung | der | Bestandtheile | einiger | Edelsteine | von | Franz Carl Achard, | [...7 lines of titles and memberships...] | [ornament] | [double rule] | Berlin, | bey Arnold Wever 1779.

8°: A-H⁸; 64ℓ.; [1]-128 p., 2 folding plates (chemical apparatus). PAGE SIZE: 200 x 122 mm.

VERY SCARCE. Among the earliest systematic attempts at analyzing gemstones was *Bestimmung der Bestandtheile einiger Edelsteine*. Sinkankas (1981) notes that Achard performed essentially the same kind of analysis as Bergman described the next year, and for which Bergman has been given all credit; however, Achard was not the careful technician Bergman was and his results were badly contaminated. In this work, Achard records his analyses of sapphire, ruby, zircon, emerald, garnet, and chrysoprase determined the presence of silicon, calcium, magnesium, and iron in his specimens, but as in the case of zircon where the zirconium was completely overlooked, many of the analyses are wrong (Partington). This carelessness was due in most part to the analyses being conducted in an iron crucible, which undoubtedly contaminated the results, as well as the lack of experimental technique of the author. Another paper, continuing Achard's research, was published as "Chemische Untersuchungen der Edelsteine" (see: *Abhandlungen des München Akademie*, 1800, 219-350).

8°: a⁸ A-L⁸ M¹; 97ℓ.; [i]-xvi, [1]-178 p., tables. Title vignette, head and tail-pieces.

VERY SCARCE. French translation by Jean Baptiste Dubois [see note below] of *Bestimmung der Bestandtheile einiger Edelgesteine* (Berlin, 1779). Contains a preface and notes by Dubois, and reports to the Paris Academy by Brisson, Macquer, de Fontanieu, and Cadet.

Jean Baptiste Dubois. (BORN: Burgundy, France, 1753; DIED: Paris, France, 1808) *French litterateur & agriculturist*. Dubois resided for a time in Poland, where he became councillor at court. After returning to Paris, he became a friend and assistant to Chrétien Guillaume Malesherbes [1721-1794]. After the reign of terror he held high office in the ministry of the interior. He wrote a notice of the life and labors of Malesherbes in 1806, among other works.

8°: π^8 1-39⁸ 40⁴; 205^l.; [i]-xv, [1], [1]-391, [3] p., 8 folding plates, one map. PAGE SIZE: 224 x 132 mm.

CONTENTS: [i-ii], Title page, verso two lines of quotation signed Linnaeus.; [iii]-vii, "Vorwort."—dated 30 April 1844, "Nachschrift." (pages vi-vii) dated 30 July 1855.; viii, "Befolgte Namen-Abkürzungen."; [ix]-xv, "Inhalt."; [1 pg], Blank.; [1]-367, Text.; [368]-391, "Alphabetisches Register."; [1 pg], Blank.; [1 pg], "Druckfehler."; [1 pg], Blank.

PLATES: The 8 unsigned, folding lithographic plates are numbered Tab. I to Tab. VIII. Each shows figures of crystal drawings. The large (410 x 470 mm.), unsigned, folding map is titled: "Andeutungen | der | geognost-oryktognostischen Verhältnisse | Siebenbürgens."

SCARCE. This major topographical work covers the important mining region of the Siebenbürgen located in present day Romania. In the first part of the forward, Ackner outlines his goals and reasons for writing this book. He notes that no previous work had sufficiently described the mineralogical wonders of the area. He qualifies this view by providing a list of earlier titles, and outlining the comprehensive treatment he plans. Ackner began work in 1844, which is the first date of the forward. In the "Nachschrift" that immediately follows, he recounts how the first Heft of this book was published in 1847, and that it was only after eight years of thorough research that the volume was completed in 1855. The text is a descriptive mineralogy in the arrangement of C.S. WEISS' system of classification. Each species found in the region is provided a description giving copious notes about localities, associations, crystallography, and chemistry.

ACOSTA, José de. (BORN: Medina del Campo, Spain, c1539; DIED: Salamanca, Spain, 15 February 1600) *Spanish jesuit & geographer.*

Acosta, like his brother Cristobal [c1525-c1594], belonged to the Society of Jesus (Jesuits) and from 1571 to

ACOSTA

1587 he was stationed in the West Indies and Provinzial in Peru. He learned enough of both the Aymara and Quechua languages to write a trilingual catechism in 1583. When he returned to Europe, he was for a time assigned a post in Rome, but finally returned to Spain as a rector at the Jesuit college of Salamanca. For his writings which provided detailed images of the physical and human geography of Latin America, Acosta has been called the "Pliny of the New World."

RARE. Acosta's most important scientific work, *Historia natural y moral de las Indias* contains firsthand observations on many diverse phenomena witnessed by Acosta in the New World. Included are some of the earliest descriptions of altitude sickness, the nature and use of coca, farm techniques, crops, and domesticated animals of America. Also included are descriptions of Inca and Aztec history, religious observations, folk customs, and statecraft. Acosta includes detail about Mexican ideograms and Peruvian quipu and the Inca postal system.

The text consists of 7 books of which the first two are a Spanish translation of *De Natvra Nova Orbis Libri Dvo* (1st ed., Salmanticae, 1589) which was written during Acosta's stay in Perú, while the remainder of the work was written after he returned to Spain. Book 1 in 25 chapters discusses the sky, the stars, the Poles, knowledge of the ancient world of the New World, the land of Ophir, prophecies, the

aborigines of the New World, Atlantis and the origin of the Indians. Book 2 in 16 chapters describes the Tropics, meteorology and biology. Book 3 in 27 chapters concerns natural history, the weather, the Ocean and its straits, Florida, rivers and land Perú, New Spain and land still unknown, volcanoes, and earthquakes. Book 4 in 42 chapters covers minerals, metals, gold and silver, the mountains of Potosí, mines, metallurgy, use of metals, precious stones, pearls, plants (chapters 16-33), cacao (chapter 22), animals (chapters 34-42). Book 5 in 31 chapters, reviews Indian ethnology, religion, superstitions, and temples in Mexico. Chapter 6 in 28 chapters describes Mexican chronology, China, Chinese and Mexican writing systems, and the Incas. Book 7 in 28 chapters is a history of Mexico.

RARE. Translation attributed to Edward Grimston [see note below] from *Historia Natural y Moral de las Indias* (Madrid, 1590). This well known work is here for the first and only time translated into English.

Edward Grimston. (BORN: 1528?; DIED: 1599) *English bureaucrat*. Grimston studied at Gonville Hall, Cambridge and was appointed comptroller of Calais. After the capture of Calais by Guise he escaped in 1599 from Bastille to London. He was then appointed Muster-Master of the north in 1560. In 1563, he was elected a Member of Parliament. He was also employed as a spy by France.

Oblong 4°: π^2 1-14⁴; 58 ℓ .; [4], I-IX, [1], [1]-102 p., originally bound in brown paper wraps. PAGE SIZE: 235 x 285 mm.

CONTENTS: [2 pgs], Title page, verso "Nota."; [2 pgs], Errata.; I-IX, Introduction.; [1 pg], "Tableau Minéralogique."; 1-84, Tables of minerals.; 85-100, "Index."; 101-102, "Noms Des Auteurs."

RARE. This book is a classified catalog of the splendid mineral collection of Adam, arranged in a tabular manner with respect to physical properties and chemical compositions. The headings for each table give the name, crystal type, hardness, density, fusibility, solubility, composition and formula. An index facilitates the lookup of specific species. The work ends with a list of references consulted. Originally the text was published in *Annales des Mines* (see: 15, 1869, 405-626). However, to create the book, the text was corrected, additional information added and the format changed so that the individual tables occupy a single page rather than being divided at the center as occurred in the original article. That Adam carefully examined his specimens is clearly demonstrated by his discovery and description in this book of the still recognized mineral species: aerugite, chenevixite, corkite, cuprotungstite, scacchite, and xanthiosite.

F.D. ADAMS

ADAMS, Frank Dawson. (BORN: Montreal, Quebec, Canada, 17 September 1859; DIED: Montreal, Quebec, Canada, 29 December 1942) *Canadian geologist.*

Adams was educated at McGill University, receiving his M.A. in 1884 and a Ph.D. in 1902, and at the University of Heidelberg receiving a Ph.D. in 1892. After serving some time on the staff of the Canadian Geological Survey, Adams was appointed lecturer in geology at McGill University, and in 1893 professor of geology. In 1908 he took on the position of dean of the faculty of applied science at the University and for a time the role of vice principal and as acting principal were also his. Adams was elected a Fellow of the Royal Society of Canada in 1896 and of the Royal Society of London in 1907. He was president of the International Geological Society in 1913, and of the Geological Society of America in 1918. Adams was the author of many papers dealing with the igneous rocks of North America and the effects of temperature and pressure on those rocks. Towards the end of his life, he also wrote *A History of Christ Church Cathedral, Montreal* (Montreal, 1941).

SCARCE. This famous text traces the history of the geological sciences from Greek and Roman times, through the Middle Ages, the Renaissance and up to the mid-19th century of the modern era. It is not a dry recitation of obsolete ideas but a truly fascinating account of how dozens of curious, colorful systems evolved into modern geology, and its subfields.

In his treatment of the subject, Adams discusses the work of over 300 different authorities, analyzing in detail the ideas of such researchers as William Smith, Agricola, Geikie, Hutton, Werner, Aristotle, Becher, Cuvier, Kircher, and many others. He recounts the birth of modern mineralogy, paleontology and historical geology; treats the origin of metals and their ores, mountains and earthquakes, springs and rivers; describes Becher's metallic tree at the center of the earth, Greek concepts of vulcanology, Sherley's view that metals grow from seeds, da Vinci's theory of fossils, and many other quaint stories and beliefs that delight any reader interested in geology or mineralogy.

RARE. This small manual was developed to present an introduction to geology and mineralogy for students. It develops its subject through a series of questions and answers. Topics covered include geology, chemistry and paleontology. A long glossary at the end defines various mineralogical terms. According to the title, this textbook was accompanied by a suite of mineral and rock specimens to which reference is made throughout the guide.

AEPINUS (Hoch), Franz Ulrich Theodosius. (BORN:
 Rostock, Germany, 13 December 1724; DIED: Dorpat,
 Russia [now Tartu, Estonia], 10 August 1802) *German*
mathematician & physicist.

Aepinus studied medicine and mathematics at Jena
 and Rostock, where he took his M.A. in 1747, with his
 dissertation on the paths of falling bodies. In 1757, he
 settled in St. Petersburg, where he had become a member
 of the Academy of Sciences in 1755, as well as a professor
 of physics. He possessed great skill as an experimenter,
 which he applied to discovering and testing the electrical
 propertities of tourmaline. He was particularly struck by
 the similarity between the magnet and the tourmaline
 with regard to polarity. He authored, *Tentamen Theoriæ*

Electritaitis et Magnetismi (1759), "one of the most original
 and important books in the history of electricity. It is the
 first reasoned, fruitful exposition of electrical phenomena
 based on action-at-a-distance" (DSB).

PAGE SIZE: 222 x 142 mm. uncut.

CONTENTS: [2 pgs], Title page, verso blank.; [6 pgs],
 Dedication to Catherine Alexievna, signed F.V.T. Aepinus,
 13 July 1762.; [8 pgs], "Avant-Propos."; [1]-179, Text.;
 [1 pg], Blank.; [2 pgs], "Table | des Pièces contenues |
 dans ce Recueil."

RARE. A reprint of the author's original
 paper on tourmaline, "Mémoires concernant quelques
 nouvelles expériences électriques remarquables" (see:
Histoire de l'Académie Royale des Sciences et Belles
Lettres, Berlin, 12, 1756), providing additional detail
 concerning his experimental procedures. In addition,
 Benjamin Wilson's "Experiments on the Tourmalin"

AGASSIZ

(*Philosophical Transactions of the Royal Society of London*, **51**, 1759) and Duke de Noya Carafa's "Lettre du Duc de Noya Carafa à M. de Buffon" (1759) both dealing with the properties of tourmaline are reprinted with commentary by Aepinus.

Having been inspired by the electrical theories of Benjamin Franklin, Aepinus began experimenting with electricity. Eventually, he turned his attention to the tourmaline stone which was thought to produce a positive and negative electrical charge when heated. Upon experimenting with a large stone, Aepinus proved to his satisfaction the mineral did create electricity when sufficiently heated. He became entranced with this phenomenon which he compared to the dipolar behavior of magnets.

AGASSIZ

AGASSIZ, Jean Louis Rodolphe. (BORN: Motier-en-Vully, Fribourg, Switzerland, 28 May 1807; DIED: Cambridge, Massachusetts, U.S.A., 14 December 1873) *Swiss/American physician, zoologist & geologist.*

Agassiz was educated in France, Switzerland and Germany, receiving an M.D. from the University of Heidelberg in 1826 and a Ph.D. from the University of Erlangen in 1829. He conducted zoological research under GEORGES CUVIER and became professor of natural history at the University Neuchatel, Switzerland (1832-46). In 1846, he came to America teaching at Yale and Harvard. Agassiz became an American citizen in 1862, and settled in Cambridge as a professor of zoology at Harvard. He was a founding member of the National Academy of Sciences. As a professor he trained many outstanding zoologists and geologists of the next generation.

SCARCE. This important early bibliography lists all the titles known to the author and editors pertaining to zoology and geology from the earliest times to almost the time of publication. The text is in two parts. The first part (vol. 1, pp. 1-86) lists periodicals and other sources consulted, while the second is the bibliography proper, arranged alphabetically by author. The entries are abbreviated, with little detail, as is expected in a work of this scope. However, it is a valuable source for information on early works.

AGRICOLA, Georgius. (BORN: Glauchau, Saxony, Germany, 24 March 1494; DIED: Chemnitz, Saxony,

AGRICOLA

Germany, 21 November 1555) *German physician, mineralogist & mining expert.*

From 1518 to 1522, Agricola studied medicine and chemistry at Bologna, Venice and Padua. He then taught the classics at the Municipal School, Zwickau, Saxony. In 1527, he moved to Joachimsthal, Czechoslovakia, where he opened a medical practice. In this locality, with the mining activities of the surrounding area impacting his daily life, Agricola began to study mining techniques and mineralogy. After an appointment in 1533 as official historian for the principality of Saxony, which included an annual stipend, Agricola moved again. He relocated his medical practice to Chemnitz in Saxony. There he became a civic leader which lead to his being elected mayor of the town in 1546, 1547, 1551, and 1553. Agricola was one of the extraordinary scientists of his age. His texts on medical diseases suffered by miners were innovative for the time, and for his works that dealt with mining and mineralogy, he was labeled "The father of mineralogy" by no less than ABRAHAM GOTTLÖB WERNER.

BERMANNUS, 1530

Bermannus

43. — Latin, 1530 [First edition].

Georgii | Agricolae Medici | Bermannus, Sive | De Re Metallica | [ornament] | Basileæ, in ædibus Frobenianis | Anno M. D. XXX.

8°: a-h⁸ i⁴; 68ℓ.; [1]-135, [1] p. Woodcut device on title page and 3 historiated woodcut initials. Colophon, p. 135: Basilea, In Officina | Frobeniana, Anno | M. D. XXX. Froben's printers device, on verso of last leaf.

CONTENTS: [1-2], Title page, verso blank.; 3-4, "Des. Erasms Rot. | Ornatissimis Fratri | bus Andree et Christophoro | à Conritz S.D. | (Erasmi Epistola)."; 5-9, "Nobili Et Clarissimo | Viro Henrico À Con | ritz Præfecto uallis Ioachimicæ, | Petrus Plateanus S. (Epistola Nvncvpatoria)."; 10-151, "Georgii | Agricolae Berman | nus, siue de re metallica."; 131-135, "Rervm Metallicarvm | appellationes iuxta uernaculam Ger | manorum linguam, autore | Plateano."; [1 pg], Froben's printers device.

VERY RARE. *Bermannus, sive De Re Metallica Dialogus* is Agricola's first published work in relation to mining. The text of this work is in the form of a dialogue between "Bermannus," who is described as a miner, mineralogist, poet, and student of mathematics, and "Nicolaus Ancon" and "Johannes Neavius," both scholars and physicians. The main theme of the dialogue is the correlation of minerals mentioned by the ancient authors and those found in the Saxon mines. The three conversationalists wonder through the mines and discuss matters that come to their attention. There is no systematic or logical arrangement to the text, therefore. Occasionally, statements of historical or technical interest are included. The mineralogical part, while of importance for giving the first description of several minerals such as bismuth, is much improved in *De Natura Fossilium* (1st ed., Basileæ, 1546).

CONTENTS: [i-ii], Half title page, "Georgius Agricola — Ausgewählte Werke — Band II," verso blank.; [iii-iv], Title page, verso "Alle Rechte, ..."; [v], "Vorwort" — signed Helmut Wilsdorf, 24 March 1955.; [vi], Blank.; [vii]-viii, "Inhalt."; [1]-55, Essays placing the Bermannus into historical perspective.; 56-172, Translation.; 173-379, Notes, biographies, maps, glossary, all designed to help clarify the translation.; [1 pg], "Zusammenfassung."

Modern translation with commentary by Helmut Wilsdorf of the *Bermannus* (Basileæ, 1530), together with considerable additional material describing the work's historical importance. Other essays provide biographical details of people mentioned by Agricola, an equivalence dictionary of mineral names, a register of geographical locations, etc.

RARE. Translation by Johann Gottlieb Stör [see note below] of *Bermannus* (Basileæ, 1530). This is the first translation into a modern language of Agricola's first writing. There is no information as to why the translation was undertaken, or why it was published 15 years after the translator's death.

Johann Gottlieb Stör. (BORN: Engelsdorf near Leipzig, Germany, 24 November 1705; DIED: Leipzig, Germany, 5 September 1763) *German mining law expert*. Stör attended the schools of Grimma and studied theology and metallurgy at the University of Leipzig, graduating in 1729. In 1741, he was awarded an advanced degree in law from the University of Erfurt. He worked in the mining industry around Leipzig.

VERY SCARCE. This is a collected edition of Agricola's works on mineralogy, geology and mining. It consists of six separate treatises, several of which appear in print for the first time.

[A]. *De Ortu & Causis Subterraneorum* in five books has always been published in the company of other works. This is Its first appearance. The work consists of five books that contain Agricola's philosophical views on geological phenomena. The major portion of this text is a refutation of the geological ideas of the ancient philosophers, the alchemists and the astrologers. It displays Agricola's wide ranging knowledge of the classic authors and his ability in observation and dialectics. But it is when Agricola presents his own ideas that new territory was established in science.

Book I is devoted to a discussion of the origin and distribution of ground water and mineralizing jucies. The last portion of this book and that of Book II consider the origin of subterranean heat that he

attributes to burning coal and sulfur and the friction subterranean winds against the walls of caves. Book III is devoted to the origin of ore channels, while Books IV & V describe in summary the principal divisions of the mineral kingdom as given in *De Natura Fossilium*.

[B]. *De Natura Eorum quae Effluunt ex Terra* in four books also appears here for the first time. As the title indicates this is a discussion of substances that flow from the earth, such as water, bitumen, gases, etc. The major portion refers to color, taste, temperature, medicinal uses of water, and descriptions of rivers, lakes, swamps, and aqueducts. In the shadow of Agricola's other writings, it is a valueless and totally uninteresting treatise.

[C]. *De Natura Fossilium* in ten books is Agricola's most important statement on mineralogy. It has always been printed in combination with other works, and this is its first edition.

De Natura Fossilium is an epoch work often cited as the publication that marked the beginning of mineralogy as a science. In this work, Agricola approached the study of mineral substances in a naturalistic way. He rejected many myths associated with gems, and the system of classification that is inferred from his writings exhibits a degree of generalization not found in earlier handbooks. It is often considered the first attempt at systematic mineralogy, the minerals being grouped into (1) earths, like clay, ochre, etc., (2) stones like gems, semi-precious and unusual as distinguished from rocks, (3) congealed juices like salt, vitriol, alum, etc., (4) metals and (5) compounds being homogenous mixtures of simple substances and forming minerals like pyrite, galena, etc. Agricola applied physical properties such as solubility, fusibility, odor, taste, color, etc to distinguish between mineral varieties. He describes several varieties of earth, and arranged the descriptions according to the purpose for which they were used. Thus he speaks of earths used by farmers as different from those used by potters, sculptors, painters and physicians. This demonstrates that he had an awareness of problems connected with the classifying of similar substances. Agricola was a practical man and his great contribution was to mineral description. He codified much of the ancient knowledge, but in the case of theoretical mineralogy developed no new insights. References in contemporary books show that soon after Agricola mineralogical works were published, they were being cited as authoratative sources.

Book I describes the characteristics of minerals such as color, brilliance, taste, shape, hardness, etc. Book II describes the earths and Book III reviews the minerals made of congealed juices, and includes salt, soda, potash, saltpetre, alum, vitriol, orpiment, etc. Book IV treats camphor, bitumen, coal, amber, etc. Book V covers lodestone, bloodstone, gypsum, talc, asbestos, mica, geodes and various fossils, flourite and quartz. Book VI treats gems and other precious stones. Book VII in on rocks like marble, serpentine, onyx, alabaster, limestone, etc. Book VIII covers metals,

while Book IX describes various furnace observations such as making brass, gilding, tinning and furnace products like slag, copper flowers, etc. Book X covers compounds that embrace the description of a number of recognizable silver, copper, lead, quicksilver, iron, tin, antimony and zinc minerals.

[D]. *De Veteribus & Novis Metallis* in two books is a short work that also appears here in a first edition. It describes mainly historical and geographical references to the occurrences of metals and mines. Agricola had extracted this information from the Greek and Latin classic texts as well as the history of mines in Central Europe. The later material is the only original material, and is unfortunately not very extensive.

[E]. *Bermannus, sive De Re Metallica Dialogus* in one book was Agricola's first published work in relation to mining, which was first published as an independent work at Basel in 1530. In this new edition, Agricola makes many important changes and adds some new material, but later editions often reprint the text of the 1530 edition. The text of this work is in the form of a dialogue between "Bermannus," who is described as a miner, mineralogist and student of mathematics and poetry, and "Nicolaus Ancon" and "Johannes Neavius," both scholars and physicians. The main theme of the dialogue is the correlation of minerals mentioned by the ancient authors and those found in the Saxon mines. The three conversationalists wonder through the mines and discuss matters that come to their attention. There is no systematic or logical arrangement to the text, therefore. Occasionally, statements of historical or technical interest are included. The mineralogical part, while of importance for giving the first description of several minerals such as bismuth, is much improved in *De Natura Fossilium*.

[F]. *Interpretatio Germanica uocum rei Metallicae* is a translation list of German equivalents for the Latin mineralogical terms used by Agricola in his numerous writing. It first appeared in the collected edition of 1546, being included in all subsequent editions. It consists of about 500 mineralogical and metallurgical terms in Latin, many of which were invented by Agricola to clarify his explanations. This work is of great value to the study of mineralogical nomenclature.

English, 1955: The Geological Society of America | Special Paper 63 | [rule] | *De Natura Fossilium* | (Textbook of Mineralogy) | by | Georgius Agricola | Translated from the First Latin Edition of 1546 | by | Mark Chance Bandy | and | Jean A. Bandy | for the | Mineralogical Society of America. | [ornament] | [rule] | November 1955. 8°: [i]-xiii, [1], 1-240 p., frontispiece (portrait of Agricola), index.

Published as *The Geological Society of America, Spe-*

cial Paper 63. Translated by Mark Chance Bandy [see note below] and Jean Arney Bandy [?-1991] from *De Natura Fossilium* (Basileae, 1546). In the brief introduction, the translator's describe Agricola's method of classifying minerals. This is then followed by the translation proper. Notes scattered throughout the text are intended to primarily help the identification of minerals whose present names differ from those used by Agricola. Occasionally, extracts from Agricola's *Bermannus* (Basileae, 1530), an introductory work on mining, have been included to add clarity to the translation.

CONTENTS: [2 pgs], Half title page, "Georgius Agricola — Ausgewählte Werke — Band IV," verso blank.; [2 pgs], Title page, verso "Herausgeber: Dr. rer. nat. Hans Prescher | ...;" [1 pg], "Inhalt.;" [1 pg], Blank.; [1], Georgius Agricola | Die Mineralien | 10 Bücher | 1546 | ...;" [2], Blank.; [3]-7, "Mineralogische Einführung.;" [8]-12, "Historisch-philologische Einführung.;" [13]-273, Text of translation.; [274]-291, "Mineralogisch-geologische Anmerkungen.;" [292]-301, "Historisch-philologische Anmerkungen.;" [303]-312, "Lateinisch-griechisch-deutsches Mineralverzeichnis.;" [313]-344, "Mineralregister.;" [345]-395, "Personenregister.;" [396]-476, "Geographisches Register.;" [477]-548, "Sachverzeichnis."

Published as volume 4 of the series, Georgius Agricola-Ausgewählte Werke, this is a modern translation by Georg Fraustadt of *De Natura Fossilium Libri X* (Basileae, 1546), together with much supplementary material in the form of historical essays by Hans Prescher and Georg Fraustadt. Included is information placing the work in its time as well as a useful Greek-Latin-German mineralogical dictionary.

Mark Chance Bandy. (BORN: Redfield, Iowa, U.S.A., 22 July 1900; DIED: Wickenburg, Arizona, U.S.A., 3 June 1963) *American mining engineer & geologist*. Bandy was educated in mining engineering and geology at Drake University (B.S., 1922), Columbia University (M.A., 1923), and Harvard (Ph.D., 1938). He worked as an engineer with Bethlehem Steel (1927-8), the Chile Exploration Co., (1929-34), and the Patino Mines (1936-47). He became an engineer, chief geologist, and general manager with ECA-Mining Engineers (1949-51) and general manager of the Rhodesia Copper Ventures (1952-4). He lectured at St. Andrews University, Scotland in 1954-5. He was a Fellow in the Society of Economic Geologists and a member American Mineralogical Society, as well as an honorary member of the Mineralogical Society of Great Britain. The mineral "Bandyite" was named in his honor in 1935. His large and fine mineral collection accumulated through his many travels was acquired in 1963 by the Natural History Museum of Los Angeles County, where it is preserved today.

VERY SCARCE. This is the second edition of Agricola's collected works on mineralogy, geology and mining, and it is best edition being the last to be corrected and revised by the author. It consists of six separate treatises that had each appeared previously.

[A]. *De Ortu & Causis Subterraneorum* in five books has always been published in the company of other works. Its first appearance was in 1546, in the first edition of these collected treatises. However, in the present edition, the text has been revised, with new material added by Agricola.

[B]. *De Natura Eorum quae Effluunt ex Terra* in four books also had its first appearance in the first edition of 1546.

[C]. *De Natura Fossilium* in ten books is Agricola's most important statement on mineralogy. It has always been printed in combination with other works, and its first appearance was in the first edition of these collected treatises published in 1546. However, in this edition, Agricola has considerably revised the text and added new material.

[D]. *De Veteribus & Novis Metallis* in two books is a short work that also first appeared in the 1546 edition of collateral works.

[E]. *Bermannus, sive De Re Metallica Dialogus* in one book was Agricola's first published work in relation to mining, which was first published as an independent work at Basel in 1530. In this edition, Agricola makes many important changes and adds some new material, but later editions often reprint the text of the 1530 edition.

[F]. *Interpretatio Germanica uocum rei Metallica* is a translation list of German equivalents for the Latin mineralogical terms used by Agricola in his numerous writing. It first appeared in the collected edition of 1546, being included in all subsequent editions.

SCARCE. The first collected edition of Agricola's works on mines, metallurgy, mineralogy and geology creating in effect an opera omnia of his technological writings. Contained therein are the fourth Latin editions of *De Re Metallica* and *De Animantibus Subterraneis*, and the sixth Latin editions of *De Ortu & Causis Subterraneorum*, *De Natura eorum quæ effluunt ex Terra*, *De Natura Fossilium*, *De Veteribus & Novis Metallis*, and *Bermannus sive de Re Metallica, Dialogus*. The original woodcuts used in the *De Re Metallica* (1st ed., Basileæ, 1556) are a little worse for wear after over a century of life and the pagination is identical to the first printing since the 269 woodcuts have to be accommodated by the text. Only the *De Animantibus Subterraneis* had previously been published with the *De Re Metallica*.

RARE, especially in complete sets. Under the direction of the Freiberg publishing house of Craz & Gerlach, Ernst Lehmann [see note below] prepared this translation of Agricola's mineralogical writings. The first volume is a translation of *De Ortv Et Causis Svbtterraneorum*, while the second is a rendering of *De Natura Eorum, Quæ Effluunt Ex Terra*, the third in two parts is of *De Natura Fossilium* and the fourth is of *De Veteribus Et Novis Metallis*. Lehman has added commentary notes to the text.

Ernst Johann Traugott Lehmann. (BORN: Baruth, Germany, 10 March 1777; DIED: Freiberg, Germany, 6 December 1847) *German mining expert*. Lehmann held a variety of positions in mining at Freiberg, before being named an instructor and finally professor of mining at the famous Bergakademie of the city. He authored a systematic encyclopedia of mining science in 1804.

VERY SCARCE. *De Re Metallica* is the first systematic treatment of mining and metallurgy and one of the most important technological volumes published in the sixteenth century. Written by Agricola over the course of 20 years, the manuscript was probably completed by 1550; however, the hundreds of woodcut used for illustration delayed publication until after Agricola's death. Everything known by Agricola concerning mining and metallurgical techniques is contained therein, including sections on prospecting, mine construction and administration, procedures for the manufacture of glass, alum and sulfur. The volume is further enhanced by the inclusion of two hundred and seventy-three magnificent, large woodcut illustrations by Hans Rudolf Manuel Deutsch depicting a large variety of mine and refinery processes, including water powered pumps, ore haulage, mine ventilation, furnace stoking, ore transportation, etc.

A large number of minerals are mentioned by Agricola, including many like bismuth for the first time. In addition, the mining and metallurgical processes described and illustrated are still at there core used even today. Also included are the author's last statement in Book V of physical geology, including his theories of the influence of water and wind on the shaping of the landscape, and a rather clear account of the stratification of rocks he saw within mines. His description of how the action of water erodes the landscape much in advance of his age.

VERY RARE. Translated by Philip Bech [see note below] from *De Re Metallica* (Basiliæ, 1556), and containing the same woodcut illustrations mostly by Rudolf Manuel Deutsch as the original edition. The Elector Augustus commanded that Agricola have *De Re Metallica* rendered into German so that the mine workers, who did not know Latin, could make use of the work. It is a bad rendition, by one who knew nothing of the science, and who had no appreciation of the special Latin terms coined by Agricola, most of which he translated literally. For example, the Hoover’s call it “a wretched translation.” But Bech, whose translation it was, admitted in many a point I am not satisfied with my translation. This is due to the shortness of the time and because I have not translated from Latin into German in former times. None the less, the text of this German edition was reprinted essentially unchanged in 1580 and again in 1621, with only new titles and preliminaries. These German editions appear to be much rarer than the Latin originals, no doubt owing to the fact that most miners and metallurgists found it more convenient to read the work in the vernacular.

Facsimile reprint, c1985: *Vom Bergkwerck xij Bücher darinn alle Empter, Instrument, Bezeuge, vnnd alles zū disem Handel gehörig ... erstlich in Lateinischer Sprach durch ... Georgium Agricolum ... jezundt aber verteüschet durch*

2^o: *4 a-z⁶ A-Y⁶ 2V⁶; 282^l; [8], 1-504 (i.e., 542), [8] p., 2 woodcut tables, 270 text woodcuts. Froben's printer device (title and last page) and ornamental initials. PAGE SIZE: 324 x 206 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [3 1/3 pgs], "Alla Serenissima ... Lisabeta ... Regina ..."; [2/3 + 1 pg], "Michel'angelo Florio Fiorentino."; [1 pg], Blank.; 1-511, Translations of Agricola's works on metals and mining.; 512, "Giorgio Agricola A Gior- | gio Fabricio."; 512-504 (i.e., 542), "Libro Di Giorgio | Agricola De Gl'Animali | di Sottta Terra..."; [5 pgs], "Indice Breve ... De l'Arte de Metalli."; [1 pg], "Indice Breve...de gl'Animali Sotteranei."; [1 pg], "In Basileae. | per Hieronimo Frobenio Et | Nicolao Episcopo | M. D. LXIII."; [1 pg], Froben's device.

RARE. Translation by Michelangelo Florio Fiorentino [see note below] of *De Re Metallica* (1st ed., Basiliæ, 1556). First Italian edition, using the same Hans Rudolf Deutsch woodcuts of Froben's Latin (1556, 1561) and German (1557) editions. The translator's dedication to England's Queen Elizabeth I (*2-*4) is usually not bound in. It appears that copies of this work sold in Italy had these leaves removed to avoid being censored as heretical. The relationship between the translator and the printer Froben is unknown.

Michelangelo Florio Fiorentino. (BORN: 1525; DIED: 1691) *Italian translator*. Fiorentino, an Italian Protestant who fled Italy for England, was the father of the Elizabethan writer John Florio [1553-1625], who produced the famous *World of Wordes*. He was patronized by Sir William Cecil and Cranmer, and produced several literary works.

AGUILERA, José Guadalupe. (BORN: Mapimí, Durango, Mexico, 1857; DIED: Mexico City, Mexico, 1941) *Mexican geologist*.

In 1876, Aguilera moved to Mexico City to obtain a degree in assaying from that city's school of mines. While there he became proficient in the chemical analysis of minerals and subsequently, he was appointed custodian of the mineral and geology collections. He actively collaborated in the Comisión Geográfica Exploradora (founded 1878) and participated in the geological explorations of the states of Oaxaca, Tlaxcala and Puebla. In 1884, the government sent him to the Smithsonian Institution in Washington for extended studies. Upon his return, he was appointed to many positions of leadership in the geological exploration of Mexico. In 1886, Aguilera participated in the creation of the Instituto Geológico Nacional; he was its director from 1895 to 1914. During his tenure, numerous publications describing the geology of Mexico were published under the oversight of the Instituto.

VERY SCARCE. Although dated, this work is perhaps the fullest treatment of the minerals of Mexico, giving a valuable catalog of the mineral species found in the country. It was printed as *Instituto Geológico Mexico, Boletín No. 11*. In it the minerals are arranged according to the classification system presented in Dana's *System of Mineralogy* (6th ed., New York, 1892), with individual localities within Mexico being given fully in connection with each species. The book begins with a prolog where the author explains that the large quantity of mineral species found in Mexico made the country an obvious candidate for a topographical mineralogy. An overview of the mineralogical system is then presented, followed by a list of mineral species known to occur in Mexico together with their localities. Another section reverses the order by first listing the geographical location together with the species known to occur there. The volume closes with a list of abbreviations and an index to the species mentioned in the catalog.

AIKIN

AIKIN, Arthur. (BORN: Warrington, Lancashire, England, 19 May 1773; DIED: London, England, 15 April 1854) *English chemist & mineralogist.*

Aikin originally trained to be a Unitarian minister; however, under the influence of the chemist Joseph Priestly [1733-1804], he was convinced to pursue a career in chemistry and mineralogy. Aikin edited from 1803 to 1808 the *Annual Review*. He was a founding member of the Geological Society of London, and for many years held the position of its secretary. He was also secretary of the Society for the Encouragement of Arts, Manufacturers and Commerce and the first treasurer and later president of the Chemical Society.

| Mineralogy | And Other Branches Of | Natural History. | [tapered rule] | By Arthur Aikin. | [tapered rule] | London: | Printed For J. Johnson, No. 72, St. Paul's | Church-Yard. | [rule] | 1797.

8°: A-Q⁸; 128 ℓ .; [i]-xvi, [1]-231, [9] p., one folding plate (unsigned, showing several cross sections). PAGE SIZE: 202 x 124 mm.

CONTENTS: [i-ii], Title page, verso blank.; [iii], Dedication to Charles Kinder and Charles Rochemont Aikin.; [iv]-xii, "Preface."; [xiii]-xvi, "Contents."; [one folding plate]; [1]-231, Text.; [1 pg], "Explanation of the plate."; [7 pgs], "Index."; [1 pg], Blank.

SCARCE. This is an account of an extensive tour made by Aikin throughout northern Wales in the summer of 1796. It was undertaken in part as a pleasant excursion and also partly to increase the author's mineralogical knowledge by examining the geological formations encountered along the way. A great number of mineralogical observations are included, but the volume is also gives vivid descriptions of the grandeur of the Welsh landscape, written in Aikin's familiar style. The text is divided into nineteen chapters, each describing observations made on a relatively short journey from one town to another.

PLATES: The frontispiece to volume one is "An Arrangement of furnaces in Mr. Pepy's Laboratory," signed E. Aikin del. Lowry sculpt. At the end of volume two there are fifteen engraved plates. Plates 10 and 11 are signed, E. Aikin del. Lowry sculpt., and plates 13 through 15 are signed, J. Simpkins, sc. Plates 1–12 show various chemical apparatus and furnaces, while plates 13–15 show various crystal drawings.

SCARCE. Co-authored with Charles Rochemont Aikin [see note below]. "The intention has been to give a faithful and sufficiently detailed description of all the important facts hitherto discovered in the sciences of Chemistry and Mineralogy, enlarging more particularly on those parts which are of peculiar interest to the Manufacturer and to the Practical Chemist." (Preface).

This work was written as a practical tool to guide the manufacturer and chemist, having been inspired by the *Chimie Appliquée aux Arts* of the French industrial chemist, Jean-Antoine Chaptal [1756-1832]. Therefore, almost all information regarding historical perspectives and theoretical matters, including medicine, magnetism, galvanism, etc., has been omitted. Descriptions of the procedures are always guided by what is known to work, with only slight speculation on the reason why. For many years during the industrial period, this was the premier dictionary in English on the described subjects. An appendix was also published [which see next entry].

Charles Rochemont Aikin. (BORN: Warrington, Lancashire, England, 1775; DIED: London, England, 20 March 1847) *English physician & chemist*. Charles was the brother of Arthur Aikin. He was a member of the Royal College of Physicians and secretary of the London Medical and Chirurgical Society.

MANUAL OF MINERALOGY, 1814

71. — English, 1814 [First edition].

A | Manual | of | Mineralogy, | By Arthur Aikin, | Secretary to the Geological Society. | [tapered rule] | London: | Printed by Richard and Arthur Taylor, Shoe-Lane, | for Longman, Hurst, Rees, Orme, and Brown, | Paternoster-Row. | [rule] | 1814.

8°: π^8 b-d⁸ B-L⁸ M²; 114ℓ.; [i]-lx, [1]-164 p. PAGE SIZE: 184 x 115 mm.

CONTENTS: [i-ii], Title page, verso blank.; [iii], "Advertisement."—dated June 10, 1814.; [iv], Blank.; [v]-lvii, "Introduction."; [lviii], Blank.; [lix]-lx, "General Synopsis."; [1]-7, "Class I. Non-Metallic Combustible Minerals."; [8], Blank.; [9]-72, "Class II. Native Metals and Metalliferous Minerals."; [73]-150, "Class III. Earthy Minerals."; [151]-154, "Class IV. Saline Minerals." [155]-164, "Index."

SCARCE. This work was based upon lectures Aikin delivered during the winter of 1814 before members of the Geological Society of London. It is written in a clear, lucid manner so that even a beginner could gain insight to the science. The introduction provides preliminary information about the science of mineralogy, including definitions and reasons why the science should be studied. An outline of the classification system proposed by the author is provided. This is followed by the descriptive

mineralogy, which takes up the remainder of the work. The work deals principally with the procedures used to identify mineral substances. The author describes the properties that are peculiar to each mineral and how they might be used to distinguish between similar species. Aikin was one of the most accomplished mineralogists of his time, and the easy narrative he adopts throughout this work undoubtedly helped popularize mineralogical studies.

ALBERTUS DE SAXONIA. (BORN: Saxony, Germany, c1330; DIED: c1390) *German theologian, philosopher & naturalist.*

Albertus was the son of a Saxon framer. He graduated from the University of Paris and was appointed the first Rector of the University of Vienna in 1365. Then from 1366 to 1390 he was Bishop of Halberstadt in Germany. As a logician, he was at the forefront of the movement that expanded the analysis of language based on the properties of terms, especially their reference (in Latin: *suppositio*), but also in the exploration of new fields of logic, especially the theory of consequences. As a natural philosopher, he contributed to the spread of Parisian natural philosophy throughout Italy and central Europe. Because of the authority of his name, the *pseudo*-Albertus Magnus work, *Liber aggregationis* or *Secreta de herbis, lapidibus et mineralibus* was sometimes issued under his name.

VERY SCARCE. Inaugural-dissertation by Emil Stange [1864-] describing Arnoldus Saxo's 13th century *Encyclopaedia*.

REFERENCES: NUC.

76. — German, 1905-7.

Die Encyklopädie des Arnoldus Saxo, zum ersten Mal nach einem Erfurter Codex herausgegeben von ... Emil Stange ... Erfurt, 1905-7.

3 parts. All the parts appeared as volumes of the *Beilage to Jahresbericht of the Königliches Gymnasium in Erfurt*. "1905. Progr. Nr. 278," "1906. Progr. No. 289" and "1907. Progr. Nr. 289."

RARE. Edited by Emil Stange [1864-], this is the only translation into a modern language of Arnoldus Saxo's major work, which is recognized as one of the first encyclopedias of the 13th century. Arnold was probably a doctor and teacher, who may well have known ALBERTUS MAGNUS. He was a privileged witness to the transmission of the Greek-Arabic texts as they spread through Europe after the Dark Ages. In particular the works of Aristotle captured his attention. Writing between 1220 and 1230, he authored a compilation of knowledge that he titled, *De finibus rerum naturalium*. Basing his text on the Latin translations of Greek and Arabic writings, he divided the material into five books: I. De coelo et mundo. II. De naturis animalium. III. De gemmarum virtutibus. IV. De virtute universali. V. De moralibus. The third part, or lapidary, was especially popular during the Middle Ages. In it he quotes Aristotle, Dioscorides, and "Aaron and Evax" (i.e., Marbode). It was used by Thomas of Cantimpré, Bartholomaeus Anglicus, Albertus Magnus, Vincent, of Beauvais, when writing their own works, but was not quoted except by the last named and by the anonymous author of the *Hortus Sanitatis*. It was also early on anonymously translated into Hebrew as, *Sefer Ha-Abanim*.

ALBERTUS MAGNUS. (BORN: Lauingen, Swabia, Germany, 1193; DIED: Cologne, Germany, 15 November 1280) *German naturalist & theologian.*

Albertus was one of the most famous authors of the High Middle Ages. He was born to a wealthy and powerful family, which provided him with a good Classical education. He studied liberal arts at Padua, where he came under the influence of Joranus of Saxony [?-1236], Master General of the Dominican Order. Against his family wishes, Albert vowed to a life of poverty and entered the Order, eventually being ordained a priest. Around 1241, he was sent to the University of Paris where he quickly rose to the post of Master of Theology. His devotion and knowledge soon lead to his appointment to establish in Cologne a *studium generale*. This education center was to occupy and consume Albertus for the remainder of his life; among his illustrious students were Thomas Aquinas [1227-1274], Thomas of Cantimpré [1201-after 1280] and Ulrich of Strassburg and Giles [?-1278]. In 1260 the Pope appointed Albertus Bishop of Regensburg, a post he resigned in 1262. The remainder of his long life was devoted to preaching, teaching and writing, primarily at Cologne. He was the most influential medieval educator of the Aristotelian philosophies, and through his position as provost at Cologne, he introduced

ALBERTUS MAGNUS

ALBERTUS MAGNUS

Greek teachings to the curriculum—a practice soon copied at other education centers. Albertus Magnus was canonized in 1931 by Pope Pius XI, who declared him Saint to all those who cultivate the natural sciences.

EDITIO PRINCEPS. Extremely rare. Albertus Magnus set as his life's work to place all of Aristotle's extant writings into a coherent system and to reconcile the Greek philosophies with those of the Christian world. To attain this outcome, he scoured the libraries of every monastery he visited for any writings of the Ancients. In this quest he was rewarded with the discovery of several ancient works thought lost. These he had copied under his own eyes, thus preserving them for the future when they might not otherwise have survived. However, Albert's diligence did not locate any copy of what he thought was Aristotle's *Lapidary*, and what is now known to be a pseudo-Aristotelian work. He was therefore forced to write his own work dealing with minerals. The result is of remarkable interest as it shows not only what the state of mineralogy was in

the 13th century, but what Albert thought the science should be.

The *De Mineralibus* [=Book of Minerals] is an reflection of the knowledge of minerals in the 13th century structured in the framework of ancient Greek doctrine. Following basic Aristotelian philosophy and guided only by the few lines devoted to mineral substances in Aristotle's *Meteorologica*, Albertus draws heavily upon his own observations and less so on other medieval and classical sources to describe minerals. Various duties of his religious Order caused him to take frequent trips throughout the territories of France, Germany and Italy. Along the literally thousands of miles traveled on foot by Albertus, he had many encounters with mines, miners and minerals. These impressions he retained in his memory until they were later recorded in this work. Consequently, when reading Albertus' words, there is no doubt as to the authority of his citations. One can only regret that the scope of the project was so great as to preclude observations of many phenomena.

The *De Mineralibus* is divided into five books, dealing with stones (Books I-II), metals (Books III-IV), "intermediates" (Book V), which are neither stones nor metals, but have characteristics of both. In books, I, III and V the author follows classical philosophy by discussing minerals based upon their causes. This refers to the four causes distinguished by Aristotle as material (the matter from which minerals are made), efficient (the process by which minerals are made), formal (the form which minerals take, assumed by Albertus to be based on biological propagation), and final (the reason the mineral exists). In books, II, IV and V Albertus completes his plan by individually naming stones, metals, and "intermediates," and describing each in considerable detail. This type of catalog, alphabetically arranged on the name of the stone was popular in medieval herbals and lapidaries and is a tradition that dates back at least to Pliny. Yet Albertus' *De Mineralibus* is not a simple lapidary. Even though its background is based in medieval thought, with many errors, the structure of the text is recognizable in modern textbooks (i.e., the introduction of general principles giving the origin, and physical properties of minerals, followed by descriptions of individual minerals including appearance, place of occurrence, uses, etc.). With Albertus Magnus' mineralogy, the study of minerals begins to emerge from its embryonic period into a full fledged science. The tradition of magical and curative powers in gems still permeates the text, but one feels the author fighting the superstitions of the ancient beliefs, and seeing the world in a new, more skeptical and practical view.

RARE. An important collected edition of scientific writings by the great scientist philosopher edited with notes added by the physician Marco Antonio Zimara [see note below]. Included are the author's books on mineralogy, astronomy, metaphysics, the intellect, etc. The volume is generously illustrated with woodcut scientific diagrams, and is one of the keystones in a long series of medieval scientific texts published by the heirs of Ottaviano Scoto in the early sixteenth century, mostly printed by Bonetus Locatellus [fl. 1486-1523]. The *De Mineralibus*, which includes works on chemistry and alchemy, precious stones and mineralogy generally is found in the second part.

Ottaviano Scoto. (BORN: Monza, Italy, c1440; DIED: Venice, Italy, 1498/9) *Italian publisher.* Scoto headed a distinguished family of Venetian printers. Born of a noble family of Monza, he came to Venice at the age of 35 and operated a press there between 1479 and 1484. He continued as an editor until 1498/9 whereupon his heirs, including his brothers and nephews, undertook their own activity (1499-1532). The original printer's mark of

Ottaviano Scoto, was an elegant circle from whose center extended a double cross. Within the circle are the letters O.S.M, the initials of Octavianus Scotus Modoetiensis (Ottaviano Scoto of Monza).

Marco Antonio Zimara. (BORN: Galatina, Italy, 1460; DIED: Padua, Italy, 1523) *Italian physician.* Although of humble origins, Zimara graduated from the University of Padua with degrees in philosophy and medicine. In 1507 he was named professor ordinary at Padua, and in 1514 he became mayor of Galatina. His last years were devoted to writing a guide to natural philosophy and metaphysics contained in the works of Aristotle and Averroës.

12°: [A]-Q¹² R¹⁰; 202ℓ.; [1]-391, [12] p., title page
vignette, ornamental initials. PAGE SIZE: 122 x 73 mm.

CONTENTS: [1-2], Title page, verso blank; 3-
9, "...Præfatio."; [10], blank; 11-89, "Liber I. De
Materia lapidum."; 90-224, "Liber Secundus. Qvi est de
Lapidibus pretiosis, ..."; 225-318, "Incipit Liber Tertius de
Mineralibus, in quo determinatur de metallis in communi."; [319], blank; 320-375, "In Quartum librum in Quo
determinatur de metallis in Speciali."; 376-391, "De Natura
Salis & speciebus & modis."; [12] pgs, "Index Librorum
Alberti Magni de mineralibus & rebus metallicis."

SCARCE. The text covers the use of stones and
minerals in medicine, precious stones, mineralogy in terms
of Aristotle's four elements, and a listing of known mineral
species?

21 vols.

VERY SCARCE. The collected works of Albertus
Magnus, edited by the Dominican Petri Jammy. The
De Mineralibus is contained in volume 2, part 4, pp.
201-75. The breakout of the volumes consists of: vols.
1 to 6, the Aristotelian commentaries, vols. 7 & 8,
commentaries on the Old Testament, vols. 9 to 11,
commentaries on the New Testament, vol. 12, sermons,
vol. 13, commentaries on Dionysios Areopagites and
the Compendium theologicæ veritatis, vols. 14 to 16,
commentaries on the Books of sentences of Peter
the Lombard, vols. 17 & 18, Summa theologiæ, vol.
19, Summa de creaturis, vol. 20 treatises on the
Holy Virgin, and vol. 21, Miscellanea, including the
Philosophia pauperum, and the De alchimia libellus.
There is also an index rerum memorabilium to the
Parva naturalia in volume 5.

religiose castigata, et pro auctoritatibus ad fidem vulgatæ
versionis accuratiorumque patrologiæ textum revocata,
auctaque b. Alberti vita ac bibliographia operum a p.p.
Quétif et Echard exaratis, etiam revisa et locupletata, cura
ac labore Augusti Borgnet ... Parisiis, Apud Ludovicum
Vivis, 1890-9.

38 vols.

VERY SCARCE. Collected works of Albertus Magnus,
edited by Auguste Borgnet and helped later by Emile
Borgnet, both priests. *Mineralium libri quinque* is contained
in volume five. Contains essentially the same collection
of Albertus' works as that published in 1651 but in
a somewhat different order. The main novelty is the
long introduction covering biographical and bibliographical
details.

Liber aggregationis seu liber secretorum alberti magni de uirtutibus herbarum lapidum et animalium quorundam; Liber primus de quibus quarundam herbarum.

Incipit uale p[ro]p[ri]a in pluribus locis Omnis scientia de genere bonorum est. Uerum in enim operatio aliquando bona aliquando mala propter scientiam mutatur ad bonum et ad malum finem ad quem operatur. Ex quo concluduntur duo quorum unum et primum est: quod scientia magis calis non est mala; namque per eius cognitionem potest evitari malum et prosequi bonum. Concluditur etiam secundum quod ex quo effectus laudatur propter finem atque uirupatur etiam finis scientie aliquando malus puta quando non ordinatur ad bonum uel ad uirtutem. Ex hoc sequitur quod scientia uel operatio aliquando bona uel mala. Quia igitur magis calis scientia seu cognitio bona est ut presuppositum est et mala aliquantulum existit in speculatione rationis et in speculatione naturalium secundum quod ab antiquis auctoribus examinatur et percipitur uno et ego met Albertus ut in pluribus ueritatem inueni et ueritatem suppono quo ad aliqua ex chyrantia libro et libro Alcorath primo narrabo de quibusdam herbis post de quibusdam lapidibus Tertio de quibusdam animalibus et de uirtutibus eorumdem.

EDITIO PRINCEPS. Extremely rare. As its Latin title suggests, *Liber Aggregationis*, or "book of collected items," *The Book of Secrets* is an anthology rather than a single work. The treatment of the subject matter is also sensational, reinforcing the popular myths about nature. It is divided into sections describing the marvellous properties of herbs, stones, and beasts. However, within each part the text is collected from a wide variety of sources. The text may be divided into these component parts: (1) On Herbs describes 16 herbs described in terms of their magical properties, (2) On Stones repeats 45 entries from Albertus Magnus' *Mineralia*, which is followed by a single paragraph taken from the 7th century encyclopedist, ISIDORE OF SEVILLE, (3) On Beast, in which 18 beasts—animals, birds and fish are described, and (4) On the Astrological Influence of Planets containing a treatise on the hours of the day governed by the various planets. In later editions of *The Book of Secrets* another formerly independent treatise describing "The Marvels of the World" is sometimes appended.

Although the preface and a passage at the end

of the section dealing with beasts attribute this as an original work of Albertus Magnus, it is very different from the other known writings of him. It was written, however, contemporary with Albertus or shortly after he died; the earliest surviving manuscripts are from the late 13th century, and Albertus died in 1279. It may be that *The Book of Secrets* was written by a follower of Albertus; certainly, as Thorndike writes, "There can be little doubt that it pretends to be a product of his experimental school among the Dominicans at Cologne." Sometimes the text has been attributed wrongly to Albertus de Saxonia [which see note below].

Secrets in literature became a popular tradition during the Middle Ages; texts of this type were written for the popular audience, not scholarly pursuit. Despite the scorn of the scholars, however, this literature capitalized on the prestige associated with the great scholars of the past including Albertus Magnus. They each have many works spuriously attributed to them. This is not surprising when one realizes that the intellectual climate constrained many scholars to cast their writings in the form of commentaries on the works of the ancients. For example, the whole of Albertus' vast output was intended by the author to be a commentary on Aristotle, though it contains much original work.

The most interesting fact about the *Liber Aggregationis* is not that it was written but that it enjoyed wide popularity for so long. With the introduction of mechanical printing this work became an incunabula best seller with more than 45 editions being published before 1501. It was perennially translated, reworked and edited for four more centuries with the last edition appearing in 1937.

The *Liber Aggregationis* was one of the most widely known and republished works in the literature that gained popularity during the Middle Ages. The demand for this work is demonstrated by the survival of a large number of manuscripts dating from as early as the 12th century and by the fact that several of these continued to be copied, anthologized, translated into the incunabula period. With the invention of printing the *Liber Aggregationis* was issued in more than fifty Latin editions during the 15th Century, with the first dated edition making its appearance in 1478 from the press of Johann Schriber of Bologna. During the incunabula period it also appeared in Italian, Catalan, and French versions. Commonly, the *Liber Aggregationis* was also bound with Albertus Magnus' *De Mirabilibus Mundi* and the *Parvum Regimen Sanitatis*.

Albertus de Saxonia. (BORN: Saxony, Germany, c1330; DIED: c1390) *German theologian, philosopher & naturalist.* Albertus was the son of a Saxon farmer. He graduated from the University of Paris and was appointed the first Rector of the University of Vienna in 1365. Then from 1366 to 1390 he was Bishop of Halberstadt in Germany. As a logician, he was at the forefront of the movement that expanded the analysis of language based on the properties of terms, especially their reference (in Latin: *suppositio*), but also in the exploration of new fields of logic, especially the theory of consequences. As a natural

ALBERTUS MAGNUS

philosopher, he contributed to the spread of Parisian natural philosophy throughout Italy and central Europe. Because of the authority of his name, the *pseudo*-Albertus Magnus work, *Liber aggregationis* or *Secreta de herbis, lapidibus et mineralibus* was sometimes issued under his name.

VERY SCARCE. Rel. 19e: demi-veau brun glacé à coins, dos fleuroné doré à nerfs (rel. usagée, frottée).

Les éditions des Beringos sont en général assez recherchées. Celle-ci, publiée en réalité en 1850, est illustrée de 4 bois à pleine page en noir et de 5 bois rehaussés (sur 3 planches dont 2 dépliantes) et de qqs culs-de-lampe. Le texte est un ramassis de superstitions et billevesées assez amusantes sur la nature des femmes, les vertus des pierres, les animaux et leurs fientes, les métaux, et la physiognomonie. Il se termine par un traité des fièvres (avec recettes). *Bibliotheca Esoterica*, n^o 42. s Provenance: Léon Pape ("Enchiridion Leonis Papae", vignette typographique moderne).

DAS BUCH DER VERSAMLUNG, 1508

German editions

175. Strassburg, 1508: Albertus Magnus. | Das bûch der versammlung oder | das buch der heymlichkeitē | Magni Alberti von | den tugenden der | krüter vñ edel- | gestein vñ | vō etlich | en thie- | ren. 4^o: 36 unnumb. ℓ., ornamental woodcut on the title page.

VERY RARE. Published by Martin Flach in Strassburg in 1508, this is the first German edition of the popular *Liber Aggregationis* containing sections of interest in the history of botany, zoology and mineralogy. It handles descriptions of 16 plants, 46 stones, 18 animals, including influences of the planets and medical recipes. Only a very few early German editions were published, almost all editions being in Latin.

ALDROVANDI

ALDROVANDI, Ulysse. (BORN: Bologna, Italy, 11 September 1522; DIED: Bologna, Italy, 10 May 1605) *Italian botanist & natural historian.*

Aldrovandi is regarded as one of the foremost zoologists of the Renaissance. He was born of a respectable burgher family and it was intended he should become a merchant. However, the work attracted him so little he began studying first jurisprudence in Bologna and then philosophy and medicine at Padua and Rome, receiving the degree of Doctor of Medicine in 1552. In 1560, he was appointed professor of natural history at the University of Bologna, where he remained the next 40 years, until his death. As a professor he was a favorite lecturer of the students, and his talks on botany and pharmacology were heavily attended. In order to provide teaching aids for his lectures, he founded in 1568 the Bologna City Gardens and became its first director. About this period, he was also appointed inspector of drugs and as a consequence published, *Antidotarii Bononiensis Epitome* (Bononiae, 1615), which became a model for many subsequent pharmacopædias.

Throughout his adult life, Aldrovandi spent his financial and leisure resources in the accumulation of a very large collection of natural history objects. He employed the artists of the city to create woodcuts of the objects for use in a series of large, beautifully illustrated books, covering the natural history spectrum. However, at his death, only four volumes had been published. Before he died though, the Bologna City government, in recognition of his scientific contributions, had doubled his salary. In gratitude, Aldrovandi bequeathed his collections and unpublished manuscripts to the city, where today the remains are located in the city's library and museum. This was also a shrewd move because after his death, the city decided to continue the publication of the manuscripts. The result is that all of the various researches are embodied in Aldrovandi's *Opera Omnia* (Bononiae, 1599-1668), which consists of 14 large folio volumes, covering all aspects of natural history, and forming one of the great scientific works of the seventeenth century.

VERY SCARCE. Edited by Bartolomeo Ambrosini

MVSAEVM METALLICVM, 1648.

[see note below]. Some forty years after he died, Aldrovandi's *Musaeum Metallicum* was published as a thick folio volume. Since his death, the work had existed as a manuscript, "Geologica ovvero Fossilibus" in the library collections of the University of Bologna, which had been bequeathed all of Aldrovandi's manuscripts. Even unpublished, many scholars studied it as a resource for their own researches. The value others placed upon Aldrovandi's material did not go unnoticed, which is why a former student of the author, Bartolomeo Ambrosini was entrusted by the Bologna senate to edit the material Aldrovandi had accumulated and oversee its publication. The final product is a superb book.

The work consists of a single volume divided into four books: on metals, earths, succi concreti (concrete juices), and stones (minerals, rocks, and fossils). Within each of these books, whole chapters are devoted to the consideration of a single "fossil." In a style typical of its time, each chapter then describes the fossil's medical properties, synonyms, localities, origins, varieties, and uses. Aldrovandi includes references to classical and medieval authors through out the volume in a fashion that anticipated modern scholars by compiling long lists of authorities but omitting those commonly cited (Partington, 1961-70). The antiquarian nature of the book commonly gives the names and descriptions of the items listed a strange, unrecognizable character.

However, Foresti (1887) attempted to ease the struggle by matching relatively modern names to Aldrovandi's. The comprehensive index included at the end of *Musaeum Metallicum* also makes this a reader friendly book.

Perhaps the most outstanding feature for the connoisseur of mineralogic literature are the several hundred woodcuts scattered throughout the volume. Some of these are full page but most are smaller, with many possessing a quaint, interesting character. These figures are designed to illustrate features described in the text, but since minerals do not easily lend themselves to illustration, the pictures "rather require the text to explain them" (Adams, 1934). That Aldrovandi was a man of accumulation is clearly shown by his inclusion of all facts that came to his attention without apparently any critical faculty to distinguish between the true and imaginary, the important and nonessential. A great amount of scientific value is contained in *Musaeum Metallicum* but an overburden must be removed to discover those nuggets. In truth, the author was a product of his time. The influence of the church and other authorities did not bind his writings and ideas as they had past authors, "and so," as Adams (1934) writes, "one gathers the impression that he was writing at the opening of a new age ..."

Bartolomeo Ambrosini. (BORN: 1587; DIED: 1688) *Italian physician & botanist.* Ambrosini was a pupil of Aldrovandi, who successively became professor of philosophy, botany and medicine at the University of Bologna. He also became director of that city's botanical gardens.

SYNOPSIS MUSÆUM METALLICUM, 1701

David Kellner [see note below] of *Mvsaevm Metallicvm* (Bononiæ, 1648). The work is divided into two books. The first (page 1-67) is "De Metallis in genere," which gives an overview of metals, their origins, reason for existence, etc. The second book (pages 68-258), titled "De Metallis in specie," gives detailed descriptions of various metals, including notes on the both the physical and mystical properties.

David Kellner. (BORN: Gotha, Germany, 16—; DIED: 17—) *German physician.* Kellner studied medicine in Helmstedt, receiving his M.D. in 1670 (or 1673). He worked in Nordhausen, and may have been a physician to the court. The second of his surgical dissertations is dedicated to Johann Langguth, a physician in the service of Duke Ernst of Saxony. It is possible that Langguth advanced Kellner in his work. He dedicates one of his books to Johann Scheib, the surgeon and barber of Gotha (the prince's city of residence) whom Kellner calls his friend and patron. He authored several treatises concerning mining, assaying and metallurgy.

ALFONSO X. (BORN: Burgos, Spain, 23 November 1223; DIED: Sevilla, Spain, 4 April 1284) *Spanish monarch.*

Alphonso X was son of Ferdinand III and Queen Beatriz. He ruled as King of Castilli and Leon from 1252 to 1284. An interest in science and literature caused him to establish a school for Muhammad al-Rîquti, and he completed the incorporation of the University of Salamanca

ALLAN

in 1254. He continued a campaign against the Moors, capturing Cadiz in 1262. Through his sponsorship, a translation of Old Testament was prepared by Jews of Toledo and the first history of Spain written. His policies were a catalyst in bringing Arabic knowledge to Europe. A crater on the moon was named "Alphonsus" in his honor.

8°: [a]-d⁸ e⁵ A-Y⁸; 213ℓ.; [i]-lxxiii, [1], [1]-351, [1] p., 15 folding plates of crystal drawings. PAGE SIZE: 225 x 140 mm. uncut

CONTENTS: [i-ii], Title page, verso blank.; [iii], Dedication to William Henry.; [iv], Blank.; [v]-x, "Preface."; [xi]-lxii, "Introduction."; [lxiii]-lxxiii, "Synopsis of the Arrangement."; [1 pg], "Errata."; [1]-296, Descriptive mineralogy.; [297]-328, "Appendix."—more species.; [329]-351, "Index."—colophon, p. 351, "Printed by Thomas Allan & Co., Edinburgh."; [1 pg], Blank.; [At end], 15 folding plates of crystal drawings.

SCARCE. An introductory work to mineralogy. The first part covers the terminology of mineralogical science, including specific gravity, hardness, color, transparency, lustre, streak, cleavage & fracture, other external characters, parasitic formation of minerals (i.e., pseudomorphs), chemical composition, and the use of the blowpipe. The second part is a standard descriptive mineralogy, with a section at the end covering the newest species.

An elementary introduction to mineralogy ... By William Phillips ... Fourth edition ... considerably augmented by Robert Allan ... (London, 1837).

See: Phillips, William.

ALLAN, Thomas. (BORN: Edinburgh, Scotland, 17 July 1777; DIED: Linden-Hall, Northumberland, England, 12 September 1833) *Scottish mineralogist & banker.*

Allan accumulated a large mineral collection that was subsequently bequeathed to his son Robert. This collection was later incorporated into ROBERT GREG's, which is now in the British Museum of Natural History. In 1813, Allan was influential in securing a mineralogy post in the Dublin Philosophical Society for K.L. GIESECKE. Allan wrote "Diamond" for the fifth edition of the *Encyclopedia Britannica*. Allan was elected a Fellow of the Royal Societies of London and Edinburgh. He also recognized a new mineral species from Greenland, which in 1810 was named "Allanite" in his honor by Thomas Thomson.

MINERALOGICAL SYNONYMES, 1805

185. — English, 1805 [First edition].

Mineralogical Synonymes, | Or | An Alphabetical List | Of | Mineral Names, | At Present Most Familiar In The | English, French, & German Languages | [tapered rule] | Printed At The | Caledonian Mercury Press, | Edinburgh. | 1805.

8°: [2], [1]-60, [2] p. PAGE SIZE: 146 x 94 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [2 pgs], "Notice."—dated 1 June 1805.; [1]-60, Text.; [1 pg], "Errata."; [1 pg], Blank.

EXTREMELY RARE. Published anonymously, but of the same style as Allan's other later works describing mineralogical nomenclature, and therefore attributed to him. The text compares various mineralogical names in the English, French, and German languages. The rarity of this edition suggests that it was a preliminary text, distributed to Allan's colleagues for review and comment.

REFERENCES: BL: [no copy listed]. • NUC: [no copy listed].

186. 2nd edition, 1808: An | Alphabetical List | of the | Names of Minerals, | At Present | Most Familiar in the English, French, | and German Languages, | with | Tables of Analyses. | [double rule] | Printed at the Caledonian Mercury Press, | Edinburgh. | 1808.

8°: [1]-7, [1] errata, [1]-72 p., 17 double leaves of tables. PAGE SIZE: 200 x 125 mm.

CONTENTS: [1-2], Title page, verso blank.; [3]-7, Introduction.—signed Edinburgh, July 1, 1808, T. Allan.; [1 pg], Errata.; [1]-72, "Mineralogical Synonymes."; [34 leaves], Double page tables listing the form, specific gravity, analytical researcher, and chemical information for

ALLÉON DULAC

each mineral species.

RARE. Although assigned the title of "First edition" in most bibliographies, this clearly is the second revision after the previous item. The introduction is signed T. Allan. This is one of the earliest attempts in English to compare and clarify the mineralogical nomenclature used by various authors. "As no rules have yet been established, by which mineralogical nomenclature can be regulated, every new work makes a considerable addition to the unwieldy stock of synonymes already in use; and the numerous valuable publications, which have recently appeared on mineralogy, have increased the perplexity arising from this circumstance to such a degree, that the science has been plunged into difficulties, which cannot fail to bewilder, particularly, the young student."—*Introduction*.

In this work, Allan first gives an alphabetical list of the mineral species names used by Kirwan, Jameson, Haüy, Brochant, Lucas and Brongniart. He has then added tables showing the composition of all the minerals that had been submitted to chemical analysis. These tables are divided into four classes I. Saline, II. Earthy, III. Inflammable and IV. Metallic, with the minerals arranged alphabetically within their respective tables.

Apparently two issues of this edition exist. This one, with "Caledonian Mercury Press" imprinted on the title, is not listed in BLC. Instead, they describe an issue with the imprint of "Canterbury Press" on the title page.

MINERALOGICAL NOMENCLATURE, 1814

187. 3rd edition, 1814: Mineralogical | Nomenclature, | Alphabetically Arranged; | with | Synoptic Tables | of the | Chemical Analyses | of | Minerals. | [ornament] | Edinburgh: | Printed for A. Constable and Company; | and for Longman, Hurst, Rees, Orme, and Brown, | London. | 1814.

8^o: [a]-c⁴ [A]-G⁴ H² χ^{54} ; 96 ℓ .; [i]-xxii, [1] errata, [1] blank, [54], [2], [1]-4 p., 27 double leaves of tables. PAGE SIZE: 200 x 117 mm.

CONTENTS: [i-ii], Half title page, "Mineralogical Nomenclature," verso blank.; [iii-iv], Title page, verso "Caledonian Mercury Press, Edinburgh."; [v]-xiii, "Introduction"—signed Thomas Allan, 24th Dec. 1814.; [xiv], Blank.; [xv]-xx, "Synopsis of the System adopted in this work."; [xxi]-xx, "Explanation of the List of Synonymes."; [xxiii], "Errata."; [xxiv], Blank.; [54 pgs], "Mineralogical Synonymes."—arranged alphabetically.; [1 pg], "Synoptic Tables of the Analyses of Minerals."; [1 pg], Blank.; [1]-4, "Explanation of the Tables of Analyses."; [54 pgs], 27 double-page tables describing the chemical analyses of 141 mineral species.

SCARCE. The introduction is signed T. Allan. "The idea of this little Work originated in the difficulty I experienced when the study of Mineralogy first engaged my attention. I was then so perplexed with the variety of Synonymous Terms which were indiscriminately made use of, that I was induced to frame a small manuscript vocabulary to assist my memory. This was afterwards committed to the press; and since that time so great an addition has been made, not only to the number of known minerals, but to the original stock of names, that a work of this kind requires to be renewed, were it only to keep pace with the alterations which time has introduced." (Preface).

REFERENCES: BL: [958.e.21.]. • BMC: 1, 29. • Dana's 7th (Bibliography): 65. • NUC: 9, 83. • Roller & Goodman, *Catalogue*, 1976: 1, 29.

188. 4th edition, 1819: Mineralogical | Nomenclature, | Alphabetically Arranged; | with | Synoptic Tables | of the | Chemical Analyses | of | Minerals. | [ornament] | Edinburgh: | Printed for A. Constable and Company, Edinburgh; | and Hurst, Robinson and Company, Cheapside, | London. | 1819.

8^o: [a]-b⁴ c² A-G⁴ χ^{26} ; 64 ℓ .; [i]-xx, [50], [2], [1]-4 p., 51 tables, [1] p. PAGE SIZE: 210 x 128 mm.

CONTENTS: [i-ii], Half title page, "Mineralogical Nomenclature," verso blank.; [iii-iv], Title page, verso "Caledonian Mercury Press, Edinburgh."; [v]-xi, "Introduction"—signed T. Allan, 19th January 1819.; [xii], Blank.; [xiii]-xviii, "Synopsis of the System adopted in this work."; [xix]-xx, "Explanation of the List of Synonymes."; [50 pgs], "Mineralogical Synonymes."; [1 pg], "Synoptic Tables of the Analyses of Minerals."; [1 pg], Blank.; [1]-4, "Explanation of the Tables of Analyses."; [51 pgs], Tables describing the chemical analyses of 141 mineral species; [1 pg], Blank.

SCARCE. The introduction is signed T. Allan. "In offering a Third Edition to the public, I have only to observe, that there is very little alteration made on the former—farther than the progress of the science has suggested—by the addition of new names and analyses. I have adopted the same system as before, arranging all the leading articles in alphabetical order in the list of names, while the chemical tables are contrived to exhibit a synoptic arrangement of the system." (Introduction).

ALLIONI

ALLIONI, Carlo. (BORN: Piemont, Italy, 1725; DIED: 28 July 1804) *Italian physician.*

Allioni graduated with an M.D. in 1747 and opened a medical practice in conjunction with his duties as professor of botany at the University of Turin. He was elected a member of many prestigious European academies and first treasurer, from 1801, of the Academy of Sciences of Turin.

His prime notoriety however was tied to his botanical studies with his *Flora Pedemontana* being his greatest work.

RARE. Edited by Archibald Bruce [see note below], *The American Mineralogical Journal* was the first periodical in America devoted exclusively to scientific subjects. Although its existence was short lived, from 1810 to 1814, it was recognized early in its history to give reliable information about the mineral deposits and recently discovered geological phenomena of America. In 1814 the four issues already published were collected together into a single volume. Then due to Bruce's deteriorating health, publication ceased, although the editor optimistically believed that his *Journal* would someday continue. Unfortunately, he never regained sufficient strength to resume his editorial duties and only after his death in 1818, was his vision realized. This new magazine edited by Bruce's good friend Benjamin Silliman of Yale increased its format to include all forms of science, including mineralogy and geology, and thus became the oracle for nineteenth century American science. The title it took on its debut in 1818 was: *The American Journal of Science, More Especially of Mineralogy, Geology, and the Other Branches of Natural History; Including Also Agriculture and the Ornamental as well as the Useful Arts*.

Facsimile reprint, 1968: The | American | Mineralogical Journal | Conducted by | Archibald Bruce, M.D. | Volume I | (Facsimile of the 1814 Edition) | Introduction by | John C. Greene | University of Connecticut | Forward by | George W. White | University of Illinois | [ornament] | Hafner Publishing Company, Inc. | New York and London | 1968. 8°: [2], [i]-xvii, [2] blanks, [1] portrait of Bruce, [i]-vi, [1]-270, [2] index p. Published as the first volume of *Contributions to the History of Geology*, edited by George W. White.

Archibald Bruce. (BORN: New York City, New York, U.S.A., February 1777; DIED: New York City, New York, U.S.A., 22 February 1818) *American chemist & mineralogist*. Bruce's father was head of the medical department of the British Army stationed in New York City. He was educated at a boarding school on Long Island before entering Columbia College in 1791, receiving his A.B. degree in medicine in 1797. One of medical professor's was David Hosack who had returned from Europe with a substantial mineral collection. Soon, Hosack infected Bruce with his enthusiasm for minerals, which quickly became Bruce's favorite leisurely pursuit. In 1798, Bruce sailed for Great Britain to study medicine at the University of Edinburgh. He was awarded the degree of M.D. in 1800, after which he toured France, Switzerland, Italy and England. During this tour, he became acquainted with all of the leading mineralogists of France and England. In 1803, he married in London and returned to America, where he opened a successful medical practice. In 1807, Bruce and several others founded the College of Physicians and Surgeons, now Columbia University's Medical School. In this venture Bruce was a trustee, 1807-11, registrar, 1807-11, professor of mineralogy, 1807-8 and professor of materia medica, 1808-11. In 1812, Bruce and others again founded a new medical school associated with Rutgers. There he was professor of mineralogy and materia medica, 1812-8. He died of apoplexy in 1818. Bruce's mineral collection sold for the large sum (in that time) of \$5,000, which indicates a high quality of specimen. His name is perpetuated by the mineral "Bruceite" named in his honor by F.S. Beudant in 1819.

MINÉRALOGIE, 1826

198. — French, 1826.

La | Minéralogie | enseignée | en Vingt-Quatre Leçons, | contenant la classification des minéraux d'après leurs | propriétés chimiques et physiques, leur manière d'é- | tre dans la nature, l'état et la constitution du | globe terrestre et l'opinion des savans sur les ré- | volutions qui ont ravagé sa surface, enfin l'usage | des minéraux dans l'agriculture et dans les arts. | Par J.L.A. Amondieu, Agrégé pour les sciences. | [ornate tapered rule] | Paris, | Audin, Libraire, Quai des Augustins, N° 25; | Naudin, Rue Pavée-Saint-André, N° 9; | Charles-Béchet, quai des Augustins,

N° 57; | Verdrière, quai des Augustins, N° 25. | [ornate tapered rule] | 1826.

12°: 500 p., 4 plates.

VERY RARE. A standard textbook of mineralogy, divided into 24 lessons. The introductory material covers the usual topics of physical and chemical properties, nomenclature, and classification methods. The descriptive portions classifies the mineral species using a new approach developed by the author. Here Amondieu makes use of the chemical and physical properties of the mineral to classify its species, in an approach that he asserts follows the manner of nature. Considering its popular style approach to the subject this is a suprisingly scarce work.

ANDERSON, Charles. (BORN: Moa, Stenness, Orkney Islands, Scotland, 5 December 1876; DIED: Sydney, Australia, 25 October 1944) *Scottish mineralogist.*

Anderson attended Kirkwall Burgh School and the University of Edinburgh (M.A., 1898, B.Sc., 1900, D.Sc., 1908). He was appointed mineralogist at the Australian Museum, Sydney, 22 July 1908. His doctoral dissertation was on the chemistry and crystallography of minerals from Australia. Anderson was appointed director of the Australian Museum, 14 February 1921, and switched his field of research to vertebrate palaeontology, in which made notable contributions — particularly the reclassification of *Meiolania* (the extinct horned turtle). He held membership in many Australian scientific societies. It is recorded that Anderson had a whimsical sense of humor and simple tastes, and “when measuring crystals on the goniometer, an intricate piece of apparatus, his favorite song was ‘There was a wee cooper who lived in Fife,/Nicketty, nacketty, noo, noo, noo.’”

Anleitung zum Studium der Mineralogie, für
Anfänger ... Erste Heft. Wein, Camesinischen
Buchhandlung, 1804.

8°: [30], 3-349, [5] p., one folding plate, one large
folding table.

VERY SCARCE. No more published. This is the first
published part of a proposed thorough introduction to
the study of mineralogy. It is based largely on Werner's
system of external characteristics, but also considers
the chemical constituents and crystal structure of the
minerals. Each mineral species is carefully described
with comments on its hardness, appearance, list of
synonyms, uses in industry, chemical make-up, and
locations around the world where the species is found.

ANDREAE, Johann Gerhard Reinhard. (BORN:
Hannover, Germany, 17 December 1724; DIED:
Hannover, Germany, 1 May 1793) *German apothecary.*

Andreae undertook a scientific journey from August
to October 1763 through Switzerland. He visited the most
important Alpine areas, where he recorded observations
about the climate, fossils and minerals, saltworks, thermals
baths, and glaciers. Along the way he met many of the
leading Swiss scholars, with whom he continued lengthy
correspondences.

Briefe aus der Schweiz nach Hannover geschrieben,
in dem Jare 1763. Johann G.R. Andreae ... Zweiter
Abdruck. Zürich und Winterthur, bei Joh. Caspar
Fueßli Sohn; und in Commiſſion bei Heinrich
Steiner und Comp. Buchhändlern, 1776.

4°: xxii, 245 (i.e., 345), [1] p., map of Switzerland
on title page, ten engraved figures in text, 18 folding
plates. One large folding engraved plate is signed J.R.
Holzhalf after J.C. Vogler and shows a wooden bridge-
construction closed to Schaffhausen.

VERY SCARCE. An interesting and beautiful work
that contains a wealth of information on the natural
history of Switzerland. It is the first appearance in book
form of 48 letters first published in the *Hannover'schen
Magazin* that described the trip Andreae made through
Switzerland between August and October 1763, when
he visited several of his pharmacy colleagues and various
natural history collections. Most of the plates depict
fossils, crystals, three are of birds and a few on
landscapes.

ANTHONY, John Williams. (BORN: Brockton, Massachusetts, U.S.A., 25 November 1920; DIED: El Paso, Texas, U.S.A., 8 November 1992) *American geologist & mineralogist*.

Anthony began his geology degree at Brown University before World War II. The war intervened, however, and only after his service did he move to Tucson, Arizona, where he earned his B.S. in geology in 1946. This was followed by an M.S. in 1951, and in 1965, a Ph.D. from Harvard University where he studied under CLIFFORD FRONDEL. In 1946, he accepted a position as mineralogist with the Arizona Bureau of Mines, which he retained until 1951. The experience gave him an expert knowledge of the mineralogy of Arizona. From 1951 until 1964 he rose from Assistant to Associate Professor of geology at the University of Arizona. In 1964 he was appointed a full professor at that institution—a position he kept until his retirement in 1983. Anthony held membership in the Mineralogical Society of America, the Geological Society of America, and the American Crystallographic Association. His specialty was the mineralogy and economic geology of the American southwest, as well as experimental and descriptive mineralogy. The mineral species "Anthonyite" was named in his honor by S.A. Williams in 1985.

VERY SCARCE. Co-authored with Richard A. Bideaux, Kenneth W. Bladh and Monte C. Nichols [see notes below], and continued on after Anthony's death by these individuals. This is one of the most important and valuable mineralogical references published in the late 20th and early 21st centuries, and eclipsed in its treatment of the subject only by C.A.F. HINTZE's monumental *Handbuch der Mineralogie* (Leipzig, 1898-1933). This modern *Handbook* series, complete in five volumes, encapsulates critical data about each valid mineral species. It was conceived in order to gather in one convenient place data critical to identification of all mineral species, and to provide relatively up-to-date references for each species listed. The intention is to provide sufficient information for the professional or amateur to distinguish one mineral species from another. Pertinent facts for each species have been distilled to one page and consist of the name, idealized chemical formula, crystal data, physical

properties, optical properties, cell data, X-ray powder pattern, chemistry, polymorphism & series, occurrence, association, distribution, name origin, location of type material and reference citations. This structure contains much of what is known about each mineral species, and as a mineralogical reference is unsurpassed in its thoroughness during modern times.

It is also a book valuable to amateur and professionals alike. It is fun as well as educational to browse the contents of these volumes and marvel at the variety of minerals and to consider their physical characteristics and the origin of their names. It is an especially valuable work for giving complete references and comparative chemical data for even rare species. In addition, the authors' expertise in judging specimen quality provides excellent source material for exact locality information where the best specimens have been found. This work is certainly one of the finest mineralogical treatises ever published, and hence its inclusion in this *Biobibliography* even though it is published well past the terminal date of 1920.

Richard August Bideaux. (BORN: Tucson, Arizona, U.S.A., 28 March 1935; DIED: Prescott, Arizona, U.S.A., 26 October 2004) *American mineralogist & pioneer in geological computer applications.* Bideaux is a graduate of the University of Arizona (B.S., Geological Engineering, 1959) and received his M.A. in geology from Harvard University in 1968. He discovered and helped to describe several new mineral species. As a field collector, he along with collecting partner, Richard L. "Dick" Jones [1933-1982] preserved many notable Arizona specimens, including fine examples of Defiance and Glove Mine wulfenite. He was employed at the Jet Propulsion Laboratory during the Surveyor missions to the moon, and was responsible for processing imaging data of the first pictures received by the U.S.A. from a heavenly body other than the earth. He returned to Tucson, Arizona in the late 1960's and founded Computing Associates with two partners. This company was a pioneer in computer applications in geology and mining engineering, and was responsible for determining the ore reserves of many mining companies throughout the world. As a consequence of his achievements in this area, in 1978 the University of Arizona bestowed on him the professional degree of Geological Engineer. Throughout most his life he has collected mineral specimens. A large portion of the fine collection he built was dispersed through Kristalle in 1985. He is a life fellow of the Mineralogical Society of America and a member of the Arizona Geological Society. The mineral species "Bideauxite" was named in his honor by S.A. Williams in 1970.

Kenneth William Bladh. (BORN: Chicago, Illinois, U.S.A., 7 November 1947; DIED:) *American geologist & mineralogist.* Bladh received his B.A. from Wittenberg University in 1969 and his M.S. and Ph.D. from the University of Arizona in 1973 and 1978, respectively. He is an expert in descriptive mineralogy and the low temperature geochemistry of weathering processes. He has been an Assistant Professor of Geology at Wittenberg University since 1978. Bladh is a member of the Mineralogical Society of America, the Geological Society of America, the Mineralogical Association of Canada and Sigma Xi.

Monte C. Nichols. (BORN: Davenport, Iowa, U.S.A., 1938; DIED:) *American chemist.* American chemist. Nichols was educated at the University of Arizona (B.S., Chemistry, 1960; M.S., Physical Chemistry, 1962). Formerly, he was a senior member of the technical staff, materials department, Sandia National Laboratories and winner of R&D 100 awards in 1986, 1988 and 1991 for

innovations in analytical instrumentation. Currently he is working for Aleph Enterprises. Fellow of the Mineralogical Society of America and co-author with Ernest H. Nickel [1925–] of the *Mineral Reference Manual* (New York, 1991).

APJOHN, James. (BORN: Sunville, Limericks, Ireland, 1 September 1796; DIED: 1886) *Irish physician, mineralogist & chemist.*

Apjohn studied medicine in Dublin, where he was for a long time associated with the city's general hospital. He then accepted an appointment as professor of chemistry and mineralogy at Trinity College, Dublin. In 1853, he was elected a Fellow of the Royal Society from Ireland.

DESCRIPTIVE CATALOGUE, 1850

214. — English, 1850.

A | Descriptive Catalogue | Of | The Simple Minerals | In The | Systematic Collection | Of | Trinity College, Dublin. | [ornament] | Dublin: | Printed By M.H. Gill, | Printer to the University. | MDCCCL.

8°: π^8 b² B-U⁸ Y²; 172ℓ.; [i]-xx, [1]-324 p. PAGE SIZE: 224 x 140 mm.

CONTENTS: [i-ii], Half title page, "Descriptive Catalogue, | &c. &c.," verso blank.; [iii-iv], Title page, verso blank.; [v]-xiii, "Preface.," [xiv], "Errata.," [xv]-xx, "Contents.," [1]-307, Text.; [308], Blank.; [309]-324, "Index."

SCARCE. Published anonymously, but attributed to James Apjohn. The preface provides a short history of earlier catalogs of the collection, before presenting an overview of the methods adopted in this work. Apjohn uses the arrangement of Beudant as outlined in the *Traité de Minéralogie* (2nd ed., Paris, 1830-1). Thus the collection is arranged in thirty-two sections, corresponding to the families of Beudant. Within each family, the genera and species represented in the specimens of the collection are described. An index at the end gives an alphabetical arrangement of the species mentioned.

ARBOLAYRE (or Grant Herbar).

A French herbal that was supposedly a translation of one of the early German herbals. Although the earliest edition (issued under the title "Arbolayre") was illustrated with German cuts formerly used in an edition of the *Gart der Gesundheit*, the text is completely different from the German and Latin *Hortus*. Subsequent editions were issued under the title, *Grant Herbar*.

English editions

222. First edition, 1526: [In red:] The grete herball [ornament] | [in black:] whiche [in red:] geueth [in black:] parfyte [in red:] knowledge [in black:] and [in red:] vnder | [in black:] standyng of all maner of herbes & there gracyous vertues whiche god hath | ordeyned for our prosperous welfare and helth / for they hele & cure all maner | of dyseases and sekenesses that fall or mysfortune to all maner of creatoures | of god created / practysed by many expert and wyse maysters / as Auicenna & | other. &c. Also it geueth full parfyte vnderstandyng of the booke lately pren | tyd by me (Peter treueris) named the noble experiens of the vertuous hand | warke of surgery. | [large woodcut].

2°: ♣6 A-Z6 Aa-Ee6; 174ℓ; no pagination or foliation. Title page in red and black. Woodcut title page, a full page cut of a human skeleton, and more than 470 woodcuts of plants, animals, etc. Printer's device, surrounded by a border, at the end. Two columns, 43 lines. Many errors in chapter numbers. COLOPHON (Ee6v): [Within a frame composed of border pieces:] Printer's device | ¶ Impretyd at London in South- | warke by me Peter Treueris / dwel- | lynge in the synge of the w dowens. | In the yere of our lorde god. M.D. | xxvi. the xxvii. day of July.

EXTREMELY RARE. First extant edition of the *Grete Herball*, the second herbal printed in England. "The most famous of the early herbals." (Rohde). It is the first English illustrated herbal—the herbal of R. Banckes issued

in 1525 has no illustrations.

The text consists of chapters i-cccccv. With the exception of the preface and the treatise on urines, the Grete Herball is a translation of the French *Grand Herbar* or *Arbolayre*. The preface and the treatise on urines show a strong resemblance to the corresponding parts of the German *Gart*. This English issue is important for presenting on the early English names of plants. The woodcuts of the plants are copied from the those in the Dutch herbals, probably the 1511 edition. The skeleton is copied from Grüninger's cut.

The title page cut shows a charming woodcut of a garden, with a man holding a spade and gathering grapes, and a woman throwing flowers and herbs out of her apron into a basket. Figures of female and male mandrake in the lower corners. The title cut and the text cuts reappear in the Dutch *Gart der Gesundheit* edition of 1538, issued in Ulrecht by Jan Bernits printed from the same blocks. Complete copies are exceptionally rare.

[Woodcut vignette].

2°: 148ℓ. Woodcut on title page. Several other woodcuts in the text. Gothic type in 2 column.

RARE. Translation from the French *Arbolayre* or *Grant Herbar*. This herbal is a treatise on all sorts of herbs, flowers, roots and a few minerals used as remedies. A brief description of the item is given followed by one to several paragraphs outlining medical applications. Among the minerals described is the "lapis magnetis" or loadstone, with its use in drawing iron from a wound. The treatise on urines has been copied from the *Gart*.

d'ARCHIAC, Etienne Jules Adolphe Desmier, Vicomte. (BORN: 1802; DIED: 1868?) *French geologist.*

ARDUINO

ARDUINO, Giovanni. (BORN: Caprino, Italy, 16 October 1714; DIED: Venice, Italy, 21 March 1795) *Italian geologist.*

Arduino was educated at Verona, Italy. He was employed with the government mining service, becoming director of mining works in Tuscany. He was appointed professor of mineralogy and metallurgy at Venice, and later Padua. Arduino was the first to classify rocks as Primary, Secondary and Tertiary, 1760, and also the first to recognize the volcanic origin of crystalline rocks. Arduino recognized the benefit of applying chemistry and paleontology to the chronology of geological formations for age dating purposes.

QVILATADOR, 1572

VERY RARE. A mineralogy designed to instruct ladies in the science of mineralogy. The text discusses the collecting of mineral and natural history specimens, differences between false and genuine gemstones, lapidary craft, and jewelry manufacturing. At the end is a discussion cast into a conversation between two girls about the collecting of specimens and the value of forming collections. The tone of the text suggests that the pseudonym used by the author was to hide her true gender.

ARFE Y VILLAFANE

ARFE Y VILLAFANE, Juan de. (BORN: 1535; DIED: 1603) *Spanish geologist & naturalist.*

234. — Spanish, 1572 [First edition].

Qvilatador | De La Plata, Oro, Y Piedras, | Compvesto Por Ioan Arphe | de Villafañe: natural de Leō: vezino de Valladolid. | [ornament] | Impresso en Valladolid, por Alonso y Diego Fernādez de Cor- | doua, Impressores de su Magestad. Año M.D.LXXII. | Con Privilegio.

8°: ¶⁴ A-I⁸ χ¹; 77ℓ.; [8] p., 71 numbered leaves, [4] p., illus., tables.

RARE. This early treatise written for goldsmiths, jewelers and the like contains information for those interested in precious metals and cut gems generally. The first two sections describe methods and techniques of assaying, purifying and allowing gold and silver illustrated with several woodcuts of apparatus. Other sections contain important and reliable information on weighing, sizing and valuation of precious stones. Descriptions include magical and medicinal virtues, varieties and sources of the gemstones.

DE OLEO MONTIS ZIBINII, 1690

237. — Latin, 1690 [First edition].

Francisci Ariosti | De | Oleo | Mon- | tis Zibinii
| Seu | Petroleo Agri | Mutinensis | Libellus |
E Manuscriptis membranis | editus | ab | Olig.
Jacobæo. | [ornament] | [rule] | Hafniae, Literis Reg.
Maj. & Univ. Typogr. | Joh. Phil. Bockenhoffer,
1690.

8°: [1]-79, [3] p.

CONTENTS: [1-2], Title page, verso blank.; [3]-8, Dedication.; 9-12, Preface.; 13-17, Biographical sketch of Ariosto.; 18-76, Text.; 77-79, Letter of recommendation, dated December 1462.; [1 pg], Blank.; [2 pgs], Index.

VERY RARE. One of the earliest published texts devoted to the subject of petroleum, this curious tract was published from manuscript material written over two centuries earlier. OLIGERUS JACOBÆUS, the editor, dedicates the work to the famous Italian bibliophile Antonio Magliabecchi [1633-1714]. Pages 9-12 contains "a preface to the reader giving some account of this mineral oil, or naphtha, found at Mons Zibius, Gybius, or Zilius, in the Modenesse territory, comparing it with naphtha from India and indicating certain analogies with amber. There is next a short biographical sketch—in Italian—of Ariostus, written by Antonio Libanori and communicated by Magliabecchi. The tract itself (pp.

18-38) gives an account of the oil, and then (pp. 38-76) a description of cures effected by the use of it. The work concludes (pp. 77-79) with a presentation letter from Ariostus to Duke Borsius dated December, 1462, and the Duke's reply, after which is the Index." (Ferguson).

Other editions: An enlarged edition appeared in 1698: *Francisci Ariosti De Oleo Montis Zibinii, seu Petroleo agri Mutinensis. Libellus e Manuscriptis Membranis Editus ab Oligero Jacobæo ... Nunc Autem ad fidem Codicis M. S. ex Bibliotheca Estensi Recognitus, et Recusus ...* Mutinae, Typis Antonii Capponi, 1698. 2 parts, 12°: [8], 67, [3], 35 p. [NUC: 20, 482, NA 0397921]. Another edition appeared in 1713: *De Oleo Montis Zibinii ... cum Bernhardus Ramazzini Libro de Fontibus Mutinensibus.* Patavii, 1713. 8°: [16], 248 p., one folding plate.

ARISTOTLE

ARISTOTLE. (BORN: Stagira, Chaldice, near Macedon, Greece, 384 B.C.; DIED: Chalcis, Island of Euboea, Greece, 322 B.C.) *Greek philosopher.*

Aristotle was the son of Nicomachus, physician to King Amyntas II of Macedon. He became a student of Plato, at the Athens Academy, 367-347 B.C.E. Afterward he traveled throughout the Greek world, especially Asia Minor, 347-342 B.C.E. He was appointed by Phillip II of Macedon to be tutor to his son (later called Alexander the Great). Aristotle founded and was a teacher of the Lyceum (or Peripatos) in Athens, 335-323 B.C.E. In 323 B.C.E., he retired to Chalcis upon death of his guardian, Alexander the Great. He is the founder of the systematic study of symbols and logic and theory of symbolism which enabled him to develop logic as a science. He collected facts about the natural world around him through personal observation. These he then recorded in a series of monographs which were handed down through manuscript until the invention of printing. Aristotle, as a teacher, had great influence on his students, with his ideas and ideas attributed to him, becoming the cornerstone of western science and philosophy for one and a half millennia.

LAPIDARIUS, 1473

Lapidarius

238. — Latin, 1473.

Lapidarius Aristotilis.—Quomodo virtutes pretiosorum lapidum augmentantur. — Physiognomia. Merseburg, [anonymous printer, probably Lukas Brandis], 20 October 1473.

2^o: [a¹⁰ b-d⁸ e⁶] (unsigned); 40 leaves, the first and last blank.; no pagination. Gothic type, 2 columns, 37 lines. COLOPHON (39v, col. 2): “Anno dñi Millesimoqdrin= | gentesimoseptuagesimoter | cō in uigilia xj miliū virginū | cōpletū est psens opus In | Ciuitate. Merszborg:”

CONTENTS: Folios 1, Blank.; 2r, “[A5]Tendite a falsis | pphetis qui ueni= | unt ad uos in ue= | stimentis ouū. in | trinsecus aut sunt | lupi rapaces ...”; 39v, col. 1, “Explīc liber de phisonomia | liber em diuidit in tres par | tes In pma pte tradit uide= | licz Lapidarius aristotilis. | de nouo a greco trāslat⁹ ... Scō'o quō uirtutes pci | osoz lapio' augmentat et al | terat ...”; 39v, col. 2, line 10, “Tercia pars est de ipa met | phisonomia / & incipit ibi | Restat de signis phisomie. | Anno dñi Millesimoqdrin= | gentesimoseptuagesimoter | cō in uigilia xj miliū virginū | cōpletū est psens opus In | Ciuitate. Merszborg:”; 40, Blank.

EDITIO PRINCEPS. Extremely rare. The *Lapidarius* was the first lapidary printed after the invention of mechanical printing, and this is the second book printed at Merseberg. It is attributed to Aristotle being called the “Lapidarius et Liber de physionomia of Aristotle,” but was composed long after his death because the text refers to more recent authorities such as Rasis and Albertus Magnus, and alludes to the mountains of Lombardy, St. Gotthard, a castle in Saxony, and to the river Saale which flows in Franconia and is called the Christian Saale, and that which descends towards Saxony and is known as the pagan Saale. It is a work entirely devoted to precious stones and physiognomy, “written in honor of Wenzel II, king of the Bohemians” [1266-1305]. The manuscript is preserved as a fifteenth-century text in the Public Library, Bern (MS. 513) as an anonymous physiognomy. It is an entirely different text from the Lapidary of Aristotle published by Julius Ruska at Heidelberg in 1912 [which see next entry].

The work is divided into three parts. In the first is treated the Lapidarius of Aristotle in the new translation from the Greek with all the other lapidaries and their statements as to the colors, virtues, and place of generation of each stone. The second part describes how the virtues of precious stones are increased and altered according to diverse situations, such as wearing them on the finger or in the armpit, or combining them with other things and engraving characters on them. The third part is devoted to physiognomy itself.

The printing of this work has been assigned to the printer Lukas Brandis [see note below].

Lukas Brandis. (BORN: ; DIED:) *German printer*. In 1475, Brandis published at Lübeck a world history, which was the first title published in this city.

CONTENTS: [i-ii], Title page, verso publication information.; [iii], Dedication.; [iv]-vi, Foreword.; [1 pg], Errata.; [1 pg], Blank.; [1]-92, Historical investigation.; [93]-125, Arabic text from the Codex, Paris, 2772.; [126]-182, German translation with commentary.; [183]-208, Latin text from the Codex Leodiensis.

VERY SCARCE. Translation with extensive commentary of a work attributed to Aristotle in the Middle Ages, but now recognized as a false work of his. The text was translated by Julius Ferdinand Ruska from an ancient manuscript held in the Bibliothèque Nationale Libary of Paris. It is not an authentic Aristotle treatise but authored under his name in the ninth century, in the Syriac language (by Hunain ibn Innak[?]). An early edition of this work was published also in part ([4], 92 p.) as Ruska's *Habilitatsschrift Heidelberg*, 1911, with the title: "Untersuchungen über das Steinbuch des Aristoteles."

Meteorologica

240. — Latin, 1474 [First edition].

Aristotle Opera.—Meteorologica. Libra I-IV. Padua, Laurentius Canozius for Johannes Philippus Aurelianus et fratres, VIII. Kal. Jul. [24 June] 1474.

2°: [a-c¹⁰ d⁴] (d4 blank); 34ℓ.; no pagination. Two columns, 51 lines to the page. PAGE SIZE: 436 x 275 mm.

EDITIO PRINCEPS. Extremely rare. The first printed edition of Aristotles collected works, consisting of *De Anima*, *Metaphysica*, *De Caelo*, *De Generatione*, *Meteorologica*, *Parva Naturalia*, & *Physica* appeared between 1472 and 1474 from the press of Laurentius Canozius in Padua. The *Meteora* (often spelled with an 'h', *Metheora*) presents in three books an investigation of "things aloft," and includes studies of the stars, comets, winds, the lower atmosphere, and then proceeds to an account of related phenomena like weather, tides, earthquakes, climatic changes. A fourth book is concerned with chemical change and the properties of matter and bares some measure in mineralogy. Ten diagrams illustrate the text and a map summarizes Aristotle's views on the habitable zones of the earth.

INCIPIT LEAF OF ARISTOTLE'S OPERA, 1472-4

The fourth book of the *Meteorologica* occupies a strange position in the list of the Stagirite's works. The first three books are concerned with meteorological phenomena as explained by the actions and affectivities of the moist and dry exhalations, and all such phenomena are ascribed to these agencies. Moreover, at the end of the third book a promise is made to furnish a study of the exhalations as they occur inside the earth. There two classes of matter are to be discussed, those bodies that are mined and those that are quarried. But the promised discussion nowhere appears in the extant works of Aristotle. However, around 1200 A.D. a fourth book began to appear in the manuscripts of the *Meteorologica*. Its writing was such that it was accepted as a genuine work of the master, but research in the early 20th century show conclusively that this fourth book is actually the "De Mineralibus" authored by AVICENNA.

Avicenna's work is partly a direct translation and partly a résumé of passages in from Avicenna's *Kitāb al-shifā'* (Book of the remedy). It was translated by Alfred of Sareshel in the 13th century. On the surface it describes the formation of minerals and mountains. From a scientific point of view, Avicenna's opinions on the formation of stone, rocks, and mountains are remarkably interesting in that they show an astonishing insight into the geological process. He is clear and concise in his remarks on the nature of minerals and in particular is ruthless in his criticism of the alchemists and their attempt to transmute the base metals into

ARISTOTLE

gold.

In this the first printing of all four books of Aristotle's *Meteorologica* there is contained a commentary by Averrões [see note below] on Book IV only.

Averrões. (BORN: Cordova, Spain, 1126; DIED: Morocco, 1198) *Arabian philosopher, astronomer & writer on jurisprudence.* Averrões (Arabic: Abul Walid Mahommed Ibn Achmed, Ibn Mahommed Ibn Rushd) was educated in his native city, where his father and grandfather had held the office of *cadi* (judge in civil affairs) and had played an important part in the political history of Andalusia. He devoted himself to jurisprudence, medicine, and mathematics, as well as to philosophy and theology. Under the Califs Abu Jacob Jusuf and his son, Jacob Al Mansur, he enjoyed extraordinary favor at court and was entrusted with several important civil offices at Morocco, Seville, and Cordova. Later he fell into disfavor and was banished with other representatives of learning. Shortly before his death, the edict against philosophers was recalled. Many of his works in logic and metaphysics had, however, been consigned to the flames, so that he left no school, and the end of the dominion of the Moors in Spain, which occurred shortly afterwards, turned the current of Averroism completely into Hebrew and Latin channels, through which it influenced the thought of Christian Europe down to the dawn of the modern era. Averroes' great medical work, "Culliyat" (of which the Latin title "Colliget" is a corruption) was published as the tenth volume in the Latin edition of Aristotle's works, Venice, 1527. His "Commentaries" on Aristotle, his original philosophical works, and his treatises on theology have come down to us either in Latin or Hebrew translations.

Secretis Secretorum

One of the chief characteristics of medieval literature is the degree to which anonymous and pseudonymous texts were diffused and read. The most striking example is the immense literature in a variety of languages which surrounds Alexander the Great's teacher, the philosopher Aristotle, to whom were attributed many different works with little or no claim to authenticity. In addition to the approximately forty genuine Aristotelian works known in Latin or vernacular versions during the Middle Ages, there were more than a hundred other works attributed to the master at some time during the same centuries. Some of the Latin versions are based upon Greek texts already attributed to Aristotle in Antiquity, others derive from Hebrew or Arabic roots, while others again seem to be original Latin works which became attached to the name of Aristotle at some time in their history. The most widely diffused of all these works is the one which bears the Latin title *Secretum Secretorum*. It enjoyed immense influence and the widest circulation from at least the tenth (and quite probably significantly before) to the seventeenth century, with more localized influence enduring even longer.

Not all of the *Secretis Secretorum* editions published under Aristotle's name contain the tract on mineralogy. In fact, apparently none of the dozen or so incunabula editions appear to include it. The first appearance of the work in a published edition of the *Secretis Secretorum* occurs in the 1501 edition.

245. — Latin, 1501 [First edition].

Aristotelis ... secretum secretorum ad Alexandrum / De regum regimine ... / Eiusdem designis tempestatum uentorum & aquarum. / Eiusdem de mineralibus / Alexandri aphrodisei ... de intellectu. / Auerrois ... de anime beatitudine. / Alexandri Achillini ... de Uniuersalibus. / Alexandri macedonis ... de mirabilibus Indiae / Ad Aristotelem / Woodcut.

2°: a-f⁶; 36 leaves, in double column. Fol. 36a (colophon): ... impressus Bononiae Impe / sis Benedicti Hectoris. / Anno. dñi. 1501 ... 26 / octob / Printer's mark. Title taken from the first folio.

VERY RARE. Edited by Alexandri Achillini [see note below], this text contains seven treatises on medicine and philosophy: *Secreta secretorum*; *De signis aquarum, ventorum et tempestatum*; *De mineralibus*; *Alexander Aphrodisei de intellectu*; *Averoes de beatitudine anime*; *Alexandri Achillini de universalibus* and *Alexandri Macedonis ad Aristotelem de mirabilibus Indie*. Four of these are pseudo-Aristotelian works, which were well known since the 13th century or earlier. The *Secreta secretorum* is here present in the translation of Philip of Tripoli; the *De signis aquarum, ventorum et tempestatum* on weather signs, was translated in the 13th century by Bartholomew of Messina; the third work by the pseudo-Aristotle is *De mineralibus* on gems; the fourth *Alexandri Macedonis ad Aristotelem de mirabilibus Indie* is a fictitious letter by Alexander the Great to his teacher Aristotle, describing the wonders of India and the East. Three other similar 'Indian tractates' are known, all of them connected with the romance of Alexander the Great at various points in history. All four of them were accepted during the later Middle Ages as reliable literary portraits of the Indians, especially of the Brahmans. They originated in the European culture, and became sources for later tellers and writers of fables. The three remaining treatises in the present work consist of a work by Alexander of Aphrodisias on the intellect, another by Averroes on the beauty of the soul, and a work by Achillini himself on universals.

The tract, "De Mineralibus", is based upon a manuscript translation made at the end of the 12th century by Alfred the Englishman [see note below] of Avicenna's work on minerals.

The origin of the Secret of Secrets is veiled in obscurity. All known versions go back to an Arabic original, *Kitab Sirr al-'asr*, r, of which the earliest extant fragment can be dated A.D. 941. The work itself claims, in the Proem, to have been translated from Greek into Syriac and from Syriac into Arabic by Yahya ibn-al-

Bitriq, a well-known ninth-century translator active in the period when the largest number of works was being translated from Greek into Arabic. While it is doubtful, though not impossible, that there was a Greek original, it is clear that the extant versions contain a good deal of Greek material, including a certain amount which derives from genuine Aristotelian doctrine. It also, however, contains much which certainly is traceable to Middle Eastern Islamic sources.

In structure the work takes the form of an extended letter from Aristotle to Alexander the Great, which was sent to the king while he was engaged in conquering Persia. It is thus parallel to a number of other extant letters, which purport to be epistolary exchanges between the two eminent figures, of which several exist in Greek. The Secret, as it has come down to us, evidently underwent a long period of gestation. It probably originated as a 'Mirror for Princes', a familiar medieval literary form in which a wise man (Aristotle) offers moral and political advice to an eminent political leader (Alexander). It thus contains much specific advice on how the king as handled the many requirements of his office. For example, it deals with how the king is to choose and manage his advisors, what diet he should follow, how he should dress, etc. The Secret, as it has come down to us contains much else besides. Probably through a long period of accretion it gradually became a sort of encyclopedic work comprising, in addition to its original moral and political component, much miscellaneous information on occult and pseudo-scientific subjects. Thus there are sections of astrology, physiognomy, alchemy, and magic, in addition to rather detailed medical sections.

All known versions derive from one of two Arabic versions, which are extant in a total of about fifty manuscripts. One of the versions is divided into either seven or eight books and is known as the Short Form in Manzalaoui's classification, while the other is in ten books and is known as the Long Form. It was ultimately translated into many different languages including Hebrew, Turkish, Latin, Russian, Czech, Croatian, German, Icelandic, English, Castilian, Catalan, Portuguese, French, and Italian. In some of these languages there are several versions, and in English there are as many as nine, though not all of them are complete. The Latin versions undoubtedly had the greatest fortuna and were the basis for later translations into European vernacular languages. The Russian translation, however, is from a Hebrew version.

There are two basic Latin versions, one made in the mid-twelfth century by John of Seville (Joannes Hispalensis) and extant in some hundred and fifty copies, the other made during the first half of the thirteenth century by Philippus Tripolitanus and surviving in more than three hundred and fifty manuscripts. These versions, both in their Latin form and in the many vernacular translations which came from them, were exceedingly widely read for more than four centuries in many different intellectual contexts. Among the major figures of the High Middle Ages who

ARISTOTLE

read the work carefully are Albert the Great and Roger Bacon, who wrote a Latin commentary on the Secret. Owing to its encyclopedic nature it was of interest to readers in many different fields ranging from political theory to alchemy, from physiognomy to popular moral philosophy.

Though much work has been done previously on many aspects of the Secret, we have by no means reached the stage where one can confidently place the work with its myriad ramifications in its proper historical context. Because it was transmitted in so many diverse cultures and in so many different linguistic and structural forms, to understand fully its overall historical position is beyond the capabilities of any single scholar. There are many unsolved problems of all sorts, ranging from the work's sources to the precise relationship between the various versions in many different languages.

Alessandro Achillini. (BORN: Bologna, Italy, 20 October 1463; DIED: Bologna, Italy, 1512) *Italian philosopher & classical scholar.* Achillini studied philosophy and medicine at the university of Bologna, where he became a celebrated lecturer both in medicine and in philosophy. From 1506 to 1508, he also taught at Padua. For his commentaries and editorial work, he was styled the second Aristotle. His philosophical works were printed in one volume folio, at Venice, in 1508, and reprinted with considerable additions in 1545, 1551 and 1568. He was also distinguished as an anatomist.

Alfred the Englishman. (BORN: ; DIED:) *English translator.* Also called Alfred of Sareshel and Alfred Angilicus, was one of the English scholastics who was especially important as a translator of (originally) Greek works from Arabic to Latin. His renderings of Aristotle's works occurred during the late 12th century.

8°: †-††⁴ A-R⁴; 76ℓ.; no pagination (i.e., [152] p.). COLOPHON: Mathiam [sic] Cancer Neapoli, 1555.

RARE. Edited by Franciscus Maria Storella [see note below], this is the best edited text of Aristotle's *Secretum* before modern scholarship. It is a rare edition, with only a handful of copies known to be extant. Moreover, there are two variants, one having a Naples and the other a Venetian imprint. The work is dedicated to Ettore Pignatelli, Duke of Monteleone, and contains a detailed preface, and annotations to the text.

The most significant improvement of the work is that Storella attempted in some measure to create a complete and critical text. He incorporated the information found in the Achillini edition of 1501 (reprinted 1516, 1520, and 1528). He also speaks explicitly of the abbreviated edition published by Franciscus Taegius at Pavia in 1516. Storella also claims to have used several manuscripts in preparing the text. However, Schmitt (1982) says: "On the whole Storella's efforts to improve the text seem to have been somewhat misguided and not really based on any overall understanding of how to go about it. Nevertheless, he made an attempt, and the text he printed was more complete than previous ones."

Franciscus Maria Storella. (BORN: Alessano, near Lecce, Italy, c1525; DIED: Naples, Italy, 1575) *Italian classical scholar*. Storella took a degree at Padua in 1549 and later taught at the universities of Salerno and Naples. He published a number of philosophical works, usually commentaries on ancient authorities.

Talks on Minerals; | or, | the Study of Mineralogy | made Interesting. | By | Edmund S.F. Arnold, M.D., | of Newport, R.I. | William H. Sadlier, | New York and Chicago.

8°: [1]-111, [3], [iii]-viii p., 6 woodcut diagrams. PAGE SIZE: 227 x 138 mm.

TALKS ON MINERALS, 1883

CONTENTS: [1-2], Title page, verso blank.; [3]-17, "Introductory Address"—dated April, 1883.; [18]-98, Text.; [99]-105, "Questions on Familiar Talks.; [106], Blank.; [107]-111, "Supplement."; [2 pgs], Shows 6 diagrams of geologic cross sections.; [1 pg], Blank.; [iii], "The 'Students Complete Mineral Collection.'"; [iv], Blank.; [v]-viii, "Contents"—a list of minerals mentioned in the text.

RARE. Although the title page is undated, the introduction is dated 1883. This odd textbook on mineralogy provides a beginner an adequate introduction to rocks and minerals. It describes the basic properties of rocks and minerals. In conjunction with this work, a "Complete Student Mineral Collection" could also be obtained from the author.

ARTINI, Ettore. (BORN: Milan, Italy, 29 August 1866; DIED: Milan, Italy, 7 March 1928) *Italian mineralogist.*

Artini studied at Padua and Florence, receiving his Ph.D. in science from Florence in 1887. He then became an assistant at the Mining Institute of the University of Pavia where he stayed until 1893. In 1911, Artini was appointed professor of mineralogy at the technical highschool in Milan and director of the mineralogical portion of the *Museo Civico di Storia Naturale*.

I MINERALI, 1914

256. — Italian, 1914 [First edition].

[In black:] Manuali Hoepli | [rule] | [in red:] Prof. E. Artini | [in black:] Direttore del Museo civico di storia naturale di Milano | [rule] | I | [in red:] Minerali | [in black, rule] | Con 132 Incisioni | e 40 Tavole Cromolitografiche | [vignette: rectangular coat of arms] | [in red:] Ulrico Hoepli | [in black:] Editore Libraio della Real Casa | Milano | [rule] | 1914.

8°: π^8 1-268 273; 219*l.*; [i]-xv, [1], [1]-422, 40 folding chromolithographic plates of minerals showing

169 specimens. Title in red and black. PAGE SIZE: 147 x 102 mm.

CONTENTS: [i-ii], Blank.; [iii-iv], Half title page, "I Minerali," verso blank.; [v-vi], Title page, verso "Proprietà Letteraria. Milano – Tipografia Umberto Allegretti – via Orti 2."; [vii-xi], "Indice Sistematico."; [xii], Blank.; [xiii-xv], "Prefazione."—signed Ettore Artini, February 1914.; [1 pg], Blank.; [1]-2, "Introduzione."; [3], "Parte Prima. Mineralogia Generale."; [4], Blank.; [5]-111, "Capitolo I. Proprietà morfologiche dei minerali."; [112]-154, "Capitolo II. Proprietà fisiche dei minerali."; [155]-177, "Capitolo III. Proprietà chimiche dei minerali."; [178]-185, "Capitolo IV. Giacitura dei minerali."; [186], Blank.; [187], "Parte Seconda. Mineralogia Descrittiva."; [188], Blank.; [189]-404, Descriptive mineralogy; 405-407, "Appendice."; [408], Blank.; [409]-422, "Indice Alfabetico."; [At end], 40 folding chromolithographic plates showing 169 figures.

VERY SCARCE. A popular and many times reprinted systematic Italian mineralogy. The author provides in the first half of the book sections which provide an overview of the science, definitions of terminology, descriptions of the crystal systems and crystal morphology, physical and chemical properties of minerals and the reasons why minerals are organized into the chemical-crystal systematic classification. The last half of the book is devoted to a descriptive mineralogy providing the standard information. An overall index finishes the text of the work. At the end are 40 chromolithographic plates showing a multitude of mineral specimens. These depictions are somewhat crude, but none the less they attempt to be faithful renderings of the specific species.

AVICENNA. (BORN: Afshana, near Bukhārā, 980 A.D.; DIED: Hamadhān, 1037 A.D.) *Arabic encyclopaedist, philosopher, physician, mathematician & astronomer.*

Avicenna (Arabic: Abū 'Alī al-Husain ibn 'Abdallāh ibn Sīnā) is the most famous scientist of Islam and one of the most famous of all races, places and times. He authored a great number of treatises in prose and verse, most of them in Arabic and a few in Persian. His philosophy roughly follows that of the Aristotelian tradition as modified by Muslim theology. His *Qānūn fi-l-tibb* (Canon of Medicine) is an immense encyclopedia of medicine, condensing the whole of ancient and Muslim knowledge, which had wide influence during the Middle Ages.

| Apud Brunonem Laurentium Tancken. | Anno M
DC LXXXII.

8°: [22], 278 [i.e., 272] p., 9 plates. Pages 113-118 omitted in numbering. Head- and tailpieces; initials. There is also an engraved titlepage reading: "Gebri, Regis Arabum Chymia."

RARE. An early Latin edition of Avicenna's *De Congelatione et Conglutinatione Lapidum* or *Mineralia* is included in this collection of alchemical writings, featuring Gebers *Summa Perfectionis*, *Liber Investigationis*, and *Testamentum*. Also contained in the volume the *Merlini Alegoria*, the *Expositio Epistolæ Alexandri*, Kallids *Liber Trium Verborum*, a letter by Faustus Sabaeus, and several other alchemical works and descriptions of the philosophers stone. Geber the European name given to JĀBIR IBN HAYYAN was allegedly an 8th-century Arab alchemist whose name is attached to hundreds of writings ranging from the 9th to 13th centuries. Although he did not author all of these works and in fact may not even have actually lived, the books authored in his name were the most advanced and influential alchemical texts of Islam. Many works later attributed to him, including the *Summa Perfectionis*, most probably were written by a later alchemist who wrote under Geber's reputation. This work that may be only translations of other Arabic texts became incorporated into Jābirs corpus, the influence of which became the greatest of any alchemical writings in the

West. Gebers advocacy of the sulphur-mercury theory of metals and his description of chemical methods became the premier impetuses of medieval alchemy and chemistry.

SCARCE. The "De mineralibus," appended, in medieval Arabic-Latin versions, to the fourth book of the *Meteorologica* of Aristotle. It is "partly a direct translation and partly a résumé" of passages in Avicenna's *Kitâb al-shifâ'* (Book of the remedy), made by Alfred of Sareshel.—*Introduction*.

The Avicenna contains a Latin Text, the Arabic Text, and an English translation, with considerable critical and introductory material. The text claims to be a book of Aristotle's "Physics," and on the surface it describes the formation of minerals and mountains, though the Arabic title, translated "The Book of the Remedy" points to certain secrets which must be embedded within.

From a scientific point of view, Avicenna's opinions on the formation of stone, rocks, and mountains are remarkably interesting in that they show an astonishing insight into the geological process. He is clear and concise in his remarks on the nature of minerals and in particular is ruthless in his criticism of the alchemists and their attempt to transmute the base metals into gold.

Facsimile reprint, 1982: New York, AMS Press, 1982. An unaltered reprinting of the 1927 text. ISBN: 0404184472.

Early printing of the Latin text, 1610: An earlier Latin edition appeared as: "Avicenna De Congelatione et Conglutinatione Lapidum; De Alchemia," in: *Artis Auriferae*, 1 (1610), pp. 240-245, 260-280 [Cf. NUC 27, 567, NA0528729].

BABINGTON, William. (BORN: Port Glenone near Coleraine, Antrim, Northern Ireland, 1756; DIED: London, England, 29 April 1833) *Irish physician, chemist & mineralogist.*

BABINGTON

BABINGTON

In 1797, Babington began practicing medicine in London. He also was associated with Guy's Hospital, where he lectured on chemistry. Babington was a founding member of the Geological Society of London, of which he was also elected president in 1822. He was elected a Fellow of the Royal Society of London in 1805, as well as a Fellow of the Royal College of Physicians, and founder of the Hunterian Society in London. The mineral "Babingtonite" was named after him by A. Lévy in 1824.

CONTENTS: [i-ii], Title page, verso blank.; [iii]-iv, "Advertisement."; [1]-25, Text, consisting of a series of tables.; 26, "Appendix." and "Errata."

RARE. Originally compiled for Babington's personal use to arrange his own collection of minerals. It is based upon the system of classification proposed in Baron Ignaz Edler von Born's *Catalogue Méthodique et Raisonné de la Collection des Fossiles de Mlle Éléonore de Raab* (2 vols., Vienne, 1790), with the classes, orders, genera and species being founded on chemical distinctions, while varieties are distinguished by external characteristics. "... The whole, therefore, meant to exhibit a comprehensive view of mineralogical arrangement, according to the latest and

best writers on the subject." The text of the work is a series of tables that have column headings of "Order," "Genus," "Species," "Variety" and "Analysis." Within the tables, the minerals are then grouped into the four classes: salts, earths, metals and inflammables. An appendix classifies volcanic productions.

CONTENTS: [i-ii], Half title page, "A | New System | Of | Mineralogy," verso blank.; [iii-iv], Title page, verso blank.; [v], Dedication to Sir John St. Aubyn, signed W. Babington, 1 October 1799.; [vi], Blank.; [vii]-viii, "Advertisement."; [1]-279, Text.; [1 pg], Blank.; [8 pgs],

"Index."—at end, "Printed by T. Bensley, Bolt-court, Fleet-street, London."

VERY SCARCE. In the advertisement, Babington writes that he wishes this work to be considered a continuation of his *A Systematic Arrangement of Minerals* (1st ed., London, 1795). Like its predecessor, *A New System of Mineralogy* also uses the mineral collection Babington had purchased from the Earl of Bute on which to form the basis for creating the classification. However, where the earlier publication contained a synopsis of the classification scheme with essentially no mineral descriptions, this work is essentially the expanded descriptive catalog of the specimens arranged according to the system.

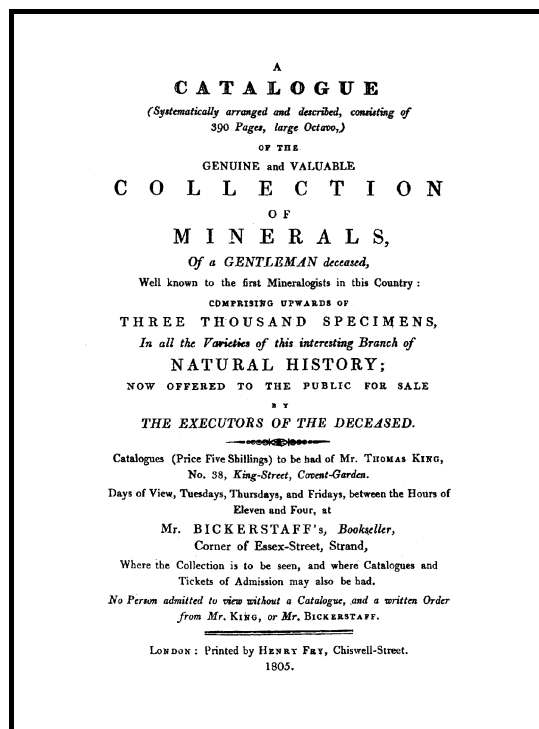

The work is dedicated to the mineral collector Sir John St Aubyn [see note below]. Babington's obligation to Baron Ignaz Edler von Born is expressed on the title page. In crystallization he was influenced by Jean-Baptiste Louis Romé de l'Isle, while most of his descriptions correspond with those of Johann Friedrich Wilhelm Widenmann and Ludwig August Emmerling. Richard Kirwan was relied upon for the chemical properties and analysis. Babington defines his classes, orders, genera, and species upon the chemical qualities, and his varieties on the external characters of minerals.

Sir John St Aubyn. (BORN: 1758; DIED: 1839) *English politician.* St Aubyn was educated at Westminster. He became sheriff of Cornwall in 1781, and a member of parliament from Truro, Cornwall in 1784. He was a Fellow of the Linnean and Royal Societies. His portrait was painted by Reynolds. St Aubyn purchased William Babington's mineral collection for the considerable sum of £3,000. After several subsequent acquisitions, including in 1799 Richard Greene's collection for £100, St Aubyn donated the bulk of the collection to the Civil and Military Library at Davenport in 1834. Through the years it was moved several times, eventually ending up in Plymouth in 1924. There the remains of it are today in the Plymouth City Museum.

8°: 318, 28, xxxvii p.

VERY RARE. The authorship of this catalog is attributed to Babington based upon a manuscript notation in the British Library copy. It describes a rich and varied collection of minerals, "selected with much Science and Expencc from several valuable Collections, especially the well-known Butean ... the Museum Geversianum and of Professor Gaubius in Holland ... together with an interesting Series of Specimens from Mont Blanc, collected by Mr. Voigt" (Address). The catalog follows the classification scheme outlined in Babinton's previously published works [see previous entries].

The whole collection is described as being contained in three Mahogany cabinets, each 6 feet tall, 2.5 feet wide and 1.5 feet deep, with 42 drawers in each cabinet. Specimens are fully cataloged including the

country locality. The collection was truly world wide in its nature, and the result of great enthusiasm on the part of the collector. Unfortunately, no reference has been found to specifically identify who this individual was. However, based upon the sheer size and variety of the collection, the compiler suspects it to be the product of the famous gentleman mineralogist William Withering [see note below].

William Withering. (BORN: Wellington, Shropshire, England, 28 March 1741; DIED: Larches near Birmingham, England, 6 October 1799) *English physician.* Withering graduated with his M.D. from the University of Edinburgh in 1766. In 1774, he then opened a medical practice in Birmingham. He was the first to describe native barium carbonate, later named after him as the mineral species, witherite. Withering is best known as a botanist, and his work on the foxglove is a classic. He was elected a Fellow of the Royal Society of London in 1784. He had collections of both minerals and plants.

BACCI

BACCI, Andrea. (BORN: St. Elpidio, Mark Ancona, Italy, 1550; DIED: Rome, Italy, c1600) *Italian physician & botanist.*

From 1567 to 1600, Bacci was a professor of botany at the University of Rome. There he lectured on poisons and described the curative properties of spas, mineral springs and baths. He was one of the personal physicians to Pope Sixtus V.

CONTENTS: [2 pgs], Title page, verso blank.; [6 pgs], Dedication, dated 15 June 1587.; 1-130, Text.; [1 pg], "All' Illvstrissimo, | Et Reverendissimo | ..."; [1 pg], Blank.; [7 pgs], Table of contents.; [1 pg], "Registro."—with woodcut device and colophon.

VERY SCARCE. The twelve gemstones of the High Priest's breast plate are discussed in the first part of the text (pp. 1-37). This is followed (pp. 38-110) by a long discussion of unicorns, being an update of the author's previous *De Monocerate sive Unicornu* (Venetia, 1566). A description of large beasts concludes the text proper (pp. 111-130). A laudatory poem, table of contents and register with a woodcut device conclude the work.

Another issue, 1587: Same as the volume described but with the imprint on the title page, Rome, G. Martinelli, V. Accolti, 1587.

Wolfgang Gabelkhover. (BORN: Memmingen, Germany, 3 September 1539; DIED: Stuttgart, Germany, 31 December 1616) *German physician & naturalist*. Gabelkhover studied

natural history, philology and medicine. He was city physician in Göppingen, before being appointed house physician and historian at the court in Württemberg. He authored medical publications and a tract on the unicorn.

J.J. BAIER

BAIER

BAIER, Johann Jakob. (BORN: Jena, Germany, 14 June 1677; DIED: Altorf, Switzerland, 14 July 1735) *German physician & naturalist.*

Baier was the father of FERDINAND JACOB BAIER. He was educated at Jena and Halle, becoming professor of medicine at the University of Altorf, Switzerland in 1704. In 1731, he was appointed personal physician to the Emperor. Baier was elected a member and ultimately president of the Leopoldina Academy [Academy of Natural Scientists].

ORYCTOGRAPHIA NORICA, 1708

269. — Latin, 1708 [First edition].

Joh. Jacobi Bajeri | Philos. et Med. D. Hvjsvqve in Acad. | Altdorf. Prof. Pvbl. | Illvstr. Reip. Norimb. Physici | OPYKTOΓPAΦIA | Norica, | sive | Rervm Fossilivm | et | Ad Minerale Regnvm | Pertinentivm, | in | Territorio Norimbergensi | Ejvsqve Vicinia Observatarvm | Svccincta | Descripto. | Cvm Iconibvs Lapidvm Figvratorm | Fere Dvcentis. | [ornate rule] | Norimbergæ, | Impensis Wolfgangi Michahellis, Bibliopolæ. | Anno MDCCLX.

4°: π^4)(1 A-M⁴ N³; 56ℓ.; [10], 1-102 p., added engraved title page, 6 folding plates (showing fossils, fossils shells and minerals), tables. PAGE SIZE: 194 x 156 mm.

CONTENTS: [2 pgs], Engraved title page, verso "In Frontem Libri."; [2 pgs], Printed title page, verso blank.; [4 pgs], Dedication, signed Joh. Jacobvs Bajervs.; [2 pgs], "Præfatio | Ad Lectorem."; 1-95, Text.; 96, "Syllabvs Capitvm."; 97-102, "Index."; [At end], 6 plates.

RARE. A classic work on the fossils and some minerals found in the region surrounding the city of Nürnberg in Germany. Baier's *Oryctographia Norica* was a new, systematic attempt to organize the natural mineral objects he found around his home city into a coherent classification. Baier did not believe in sweeping theoretical pronouncements, instead the specimens are fully described with many of the most interesting fossils depicted on the finely engraved plates. By this means he laid the foundation for the investigation of Jurassic fauna and of scientific paleontology in general and help disprove the notion that fossils were simple jests of nature. He clearly indicates that these fossils were created in the single act of the Deluge, which he considered the only great change since the Creation. The foundation Baier thus created, helped prepare the path for subsequent researchers to see the world differently and look past the myth and create through thorough observation the science of geology.

The frontispiece depicts a beach with putti presenting Cybele with baskets of ammonites, fossil echinoderms, belemnites, etc., while Neptune rides on a shell on the sea surrounded by naiads bearing baskets of shells; i.e. the affinities of the living and fossil forms. This and the six plates (which figure some 300 fossils) are the work of J.G. Puschner.

Baier clearly states in his foreword that supplemental volumes will appear to expand on the *Oryctographia Norica*, but time considerations in his life only allowed him to publish the rare 1730 supplement. However, at the time of his death, he had left material enough to allow his son Ferdinand to issue an additional supplemental volume in 1757. The publication of this, probably caused enough interest that the following year, 1758, Ferdinand issued what should be considered a rare second edition of the *Oryctographia Norica*, with a reworking of his father's original text, and a small number of plates.

German, 1958: An excellent modern German translation with extensive commentary of *Oryctographia Norica* and its 1730 supplemental volume appears in *Erlanger Geologische Abhandlungen*, 29 (1958), [1]-133 p. Besides a good introduction, there is included biographical information, much data of a historical interest, reproductions of the title pages, text figures and reproductions of the plates.

Ferdinand Jakob Baier. (BORN: Altorf, Germany, 13 February 1707; DIED: Ansbach, Germany, 23 October 1788) *German physician.* Baier was the son of JOHANN JACOB BAIER. He had a medical practice in Nurnburg, Germany. He was elected a member, later becoming president, of the Leopoldina Academy [Academy of Natural Scientists].

RARE. A student’s pocket companion to mineralogical studies, embracing a condensed description of the properties, classification method, and a tabular view of gems, arranged according to color.

REFERENCES: Ward & Carozzi, *Geology Emerging*, 1984: no. 100.

BAKEWELL, Robert. (BORN: 1768; DIED: Hampstead near London, England, 15 August 1843) *English geologist.*

Bakewell made extensive mineralogical and geological surveys in England and Ireland, after which he lectured and exhibited sections of rock formations and the beginnings of a geological map of Britain. From 1820 to ’22, Bakewell traveled throughout France and Switzerland, extending his geological surveys. His published account of these travels, published in 1823, was a popular work with the public. He invented a safety furnace for preventing explosions in coal mines.

INTRODUCTION TO MINERALOGY, 1819

277. — English, 1819.

An | Introduction | to | Mineralogy: | comprising the | Natural History and Characters of Minerals; | and a Description of Rocks, | both simple and aggregated; | with | A New Tabular Arrangement of Earthy Minerals, | on a plan designed to facilitate the knowledge | of that class of substances. | To which is refixed: | A Series of Conversations | explaining the principles of the science, | and the Elements of Crystallography. | [double rule] | By Robert Bakewell, | Author of “An Introduction to Geology.” | [double rule] | With Plates. | London: | Printed for Longman, Hurst, Rees, Orme, and Brown, | Paternoster-Row. | 1819.

8°: A⁸ a² B-Z⁸ Aa-Tt⁸ Uu⁷; 345ℓ.; [i]-xx, [1]-668, [2] p., 5 plates (folding; show crystal drawings). PAGE SIZE: 208 x 130 mm.

CONTENTS: [i-ii], Title page, verso “Printed by Strahan and Spotiswoode, Printers-Street, London.”; [iii]-xvi, “Preface”—dated June 21, 1819.; [xvii]-xx, “Table of Contents.”; [1]-642, Text.; [643], “Addenda, No. I.”; [644]-654, “Addenda, No. II.”; [655], “Addenda, No. III. Double

Magnetism.”; [656], Blank.; [5 folding plates].; [657]-668, “Index to the Names of Minerals, and to the terms employed in Mineralogy and Crystallography.”; [2 pgs], “Explanation of the crystals presented in Plates III, IV, and V.”

SCARCE. In the preface, Bakewell gives an overview of the progress of mineralogy in Europe, emphasising the contributions of René Just Haüy and Abraham Gottlob Werner. He indicates this work should be used by students of mineralogy in England to help acquaint them with the science. The text is arranged into five books. Book I (pp. 1-198) covers preliminary observations and introductory theory in 10 chapters. Included is an overview of the classification system of Haüy that is used within the descriptive portion with some modification. Book II (pp. 199-465) reviews the essential characters of the earthy minerals, including on pages 202-219 a table of minerals arranged by specific gravity and on pages 220-231 a similar table arranged according to their hardness. An appendix to Book II takes up pages 466-498. Book III (pp. 499-616) concerns the metallic species. Book IV (pp. 617-634) describes the combustible minerals, and Book V (pp. 635-642) arranges the saline minerals. The five folding plates, numbered I-V are unsigned and mostly show crystal drawings.

2 parts in one volume. [Part 1] 8°: A-B⁸ C²; 18l.;

OSSERVAZIONI SOPRA, 1750

[1]-36 p., engraved title page vignette. [Part 2] 8°: A-B⁸; 16l.; [1]-32 p., engraved title page vignette. PAGE SIZE: 190 x 115 mm.

RARE. Presented as a letter to Saverio Manetti, professor and Secretary of the SOCIETÀ BOTTANICA DI FIRENZE. Part one deals with the natural history, geology, and mineralogy of the region of Siena, Italy, and particularly with salt, discussing its mineralogical, chemical and medicinal aspects. Part two consists of a catalog of the collection of natural history products of the state of Siena, formed by a local nobleman, Giovanni Venturi Gallerani. It describes 167 specimens, mostly minerals, fossils and stones, with extensive notes. The title pages of the parts would indicate that the work was also sold as two separate and independent volumes.

German, 1751: A translation into German of this work appears in *Hamburgische Magazin*, 10, 227-250 & 339-375.

BANCROFT, Edward. (BORN: Westfield, Massachusetts, U.S.A., 9 January 1744; DIED: Margate, Kent, England, 8 September 1821) *English physician, naturalist & chemist.*

BANKS

Bancroft emigrated to England, c1770, where he made frequent contributions to the *Monthly Review*, with articles about America. He knew Benjamin Franklin and served as his secret agent in London at outbreak of American Revolution. A friend of Joseph Priestley [1733-1804], Bancroft made important discoveries in dyeing and calico-painting. He was elected a Fellow of the Royal College of Physicians and in 1783 to the Royal Society.

SCARCE. One of the earliest and most informative accounts of the flora and fauna of the Guineas, this interesting work contains four letters providing information on (1) a general account of Guiana, its location, size, climate, soil, rivers, (2) a description of the animals, birds, fish, snakes, insects, (3) an account of the native religion, manners, customs, and (4) an account of the river Berbice and the Dutch settlements thereon, including descriptions of the slave trade and the government concluding with an account of the diseases. Included on pages 21-22 is a very short descriptive account of the minerals found in the region, making this the first topographical mineralogy of the area. The frontispiece shows a depiction of a two-headed serpent.

Facsimile reprint, 1971: New York, Arno Press, 1971. 8°: iv, 402, [6] p., frontispiece (two-headed snake). Reprint of the 1769 ed., with new introductory matter. [ISBN: 0405017294].

BANKS

BANKS, Joseph, Sir. (BORN: 1743; DIED: 1820) *English naturalist.*

Banks was educated at Harrow, Eaton, and Christ Church, Oxford; studied natural history, and accompanied Cook in his expedition round the world in the *Endeavour*, 1768-71, — upon his return, created hon. D.C.L. of Oxford; built a large collection of natural history objects including minerals, which are now preserved at the British Museum; visited Iceland, 1772; made baronet, 1781; F.R.S., 1766; president of the Royal Society, 1778-1820; first to observe that almost all Australian mammals were marsupials and more primitive than placental mammals of other continents; great patron of science, where his house in Soho Square became a frequent meeting place; plant genus "Banksia" named in his honor.

BARBA, Alvaro Alonso. (BORN: Lepe, Huelva, Spain, 15 November 1569; DIED: Potosi, Peru [now Bolivia], 1662) *Spanish theologian.*

Barba entered church and became priest at Tarabuco, South America, c1609. He resided at Lepas, Peru, 1617. Then he became pastor of St. Bernards at Potosi, Columbia, a rich mining district. While there, Barba began studying the minerals, mining, and refining processes of the mines in the district. The whole of his knowledge he recorded in his *Arte De Los Metales* (1st ed., Madrid, 1640), which was kept as secret as possible by the Spaniards. He was the probable discoverer of process for extraction of gold, silver and copper by boiling ore with salt solution and mercury in copper vessel, c1607.

VERY RARE. The first significant book in Spanish on metals, minerals and mines of the New World. As a handbook on the mineral riches of the new territories, this title was banned by the Inquisition and severely limited in this its first printing, and consequently is a rarely encountered title. This book is complete with descriptions, practical directions, explanations, and illustrations of equipment for smelting gold, silver and copper. It was the first significant treatise on metals and minerals written in Spanish, and one of the few seventeenth century work's that was largely original. Barba advocated the laboratory control of the entire plant process, as well as computation of all costs associated with metal recovery. He describes in-depth his newly invented process of treating silver and gold ores with a mercury amalgamation in a copper vessel, to enhance metal recovery. It describes the fabulous wealth of the Spanish possessions in the New World, and as such the Spanish government attempted to keep Barba's book and methods secret. However, in 1669, the English ambassador, the Earl of Sandwich got a hold of a copy and published an English translation in 1670 that resulted in a large number of editions and translations. This work describes the amalgamation process used in Potosi, giving detailed accounts of ores and minerals of South America. Also covers the generation and origin of metals. The illustration shows a balance in a glass case, the first such illustration.

The editions of 1630 and 1639, recorded by many bibliographies, are probably due to printer's error for 1640, which is the first appearance of Barba's work.

Supplement, 1967: *Arte de los metales. Seguido de notas y suplementos al libro por un antiguo minero; juicios y comentarios.* Prologo de Armando. Potosi, Editorial "Potosi," 1967. xlvii, 299 p., illus., facsim.

Halla- | rase en su Tienda, en las Gradas de San Phelipe el Real.*

4^o: [4] p., 224ℓ., [4] p., 12 woodcut illus. PAGE SIZE: 216 x 146 mm.

RARE. Barba's scarce original text and illustrations on mining and metallurgy were reprinted here for the first time, almost ninety years after their first appearance. The publisher Francisco Assensio, in his dedicatory remarks, proclaims his purpose in issuing Barba's text is to assure the "perpetuity of its fame." Appended to Barba's work at page 192 is the second printing of another earlier work on the ancient mines of the Spanish empire, Alonso Carrillo y Laso's *Tratado de las Antiguas Minas de España* (1st ed., Madrid, 1624).

Carrillo y Laso's work, 1624: *De Las Antigvas | Minas De España. | Avtor Don Alonso Carrillo | Lasso, del Abio de Sanctiagio, Cauallerizo de Cordua. | Alserenissimo Infante D. Carlos. | [vignette: large coat of arms] | Con licentia, en Cordoua, Por Saluador de Cea. A. 1624. 8^o: [4], 54, [2] p.*

Alonso Carrillo Lasso. (BORN: c1582; DIED: Córdoba, Spain?, 1628) *Spanish lawyer.* Little is known of Laso, other than he was born the son of an illustrious lawyer and writer, Don Fernando.

REFERENCES: (1729) BMC: 1, 96. • *Freilich Sale Catalog*: no. 38. • Medina, *Bibliotheca Hispano-Americana 1493-1810*: no. 2707. • NUC: 34, 432-4 [NB 0106724]. • Palau, *Manual*, 1948-77: no. 23623. • Roller & Goodman, *Catalogue*, 1976: 1, 77. • BL: [457.c.14.]. • (Carrillo, 1624) Calvo Rebollar, *Bibliografía Mineralogía Españolas*, 1999: 66-7. • Maffei & Rua Figuera, *Bibliografía Mineral*, 1871-2: 1, 132-3, no. 394. 282. 3rd edition, 1770: *Arte | De Los Metales, | en que se enseña | el verdadero beneficio | de los de oro, y plata por azogue. | El Modo De Fundirlos Ttodos, | y como se han de refinar, | Y Aparta Unos De Otros. | Compuseto | Por El Licenciado Alvaro Alonso Barba, | natural de la Villa de Lepe, en la Andaluci, Cura en la | Imperial de Potosí de la Parroquia | de San Bernardo. | Nuevamente Ahora Añadido | Con El Tratado De Las Antiguas Minas | de España, que escribió Don Alonso Carrillo y Laso, | Caballero del Avito de Santiago, y Cavallerizo | de Cordova. | [ornament] | Con Licencia. | [double rule] | Madrid en la Oficina de la Viuda de Manuel Fernandez. | Año de 1770. | A costa de Manuel de Godos, Mercader de Libros en esta Corte. Se hallará | en su Tienda en las Gradas de San Phelipe el Real.*

4^o: [1]-228 (page 212 misprinted 112), [4] p., illus.

VERY SCARCE. Essentially, this is a reprint of the 1729 edition of Barba's original text, together again with Carrillo y Laso's *Tratado de las Antiguas Minas de España* (1st ed., Madrid, 1624).

Another issue, c1770: *Arte | De Los Metales, | En Que Se Enseña | El Verdadero Beneficio | De Los De Oro, Y Plata Por Azogue. | El Modo De Fundirlos Todos, | Y Como Se Han De Refinar, | Y Apartar Unos De Otros. | Compuesto | Por El Licenciado Alvaro | Alonso Barba, natural de la Villa de Lepe, | [...3 lines of titles and memberships...]* *| Nuevamente Ahora Añadido. | Con El Tratado De Las Antiguas Minas | de España, que escribió Don Alonso Carrillo y Laso, | [...2 lines of titles and memberships...]* *| [double rule] | Con Licencia. En Madrid, En La Oficina | de la Viuda de Manuel Fernandez.*

ARTE DE LOS METALES, 1770

| Acosta de Manuel de Godes, Mercader de Libros en esta Corte. | Se ballará en su Tienda en las Gradas de San Phelipe el Real. | [ornate rule]. 4^o: [1]-228, [4] p., illus.

This issue may precede the one dated 1770; however, with no date on the title page it is difficult to determine the sequence. It is essentially the same text as that dated 1770.

Reprint, c1925: México, Compañía Fundidora de Fierro y Acero de Monterrey, [c1925]. 4^o: [4], 228 p., illus. Facsimile reprint of the 1770 edition. A special edition of 1000 copies, none for sale, by the Compañía Fundidora de Fierro y Acero de Monterrey (The Iron and Steel Company of Monterrey, Mexico). The entire book is reproduced in facsimile from a copy in the possession of the National Museum of Mexico library. Of added interest is an historical-bibliographical essay of Barba's work in its many editions.

Reprint, 1939: Madrid, Escuela Especial de Ingenieros de Minas, 1939. 4^o: [19], 228 p., illus. Includes facsimile of title page and introductory material of the first edition.

RARE. Translated by the Right Honorable Edward, Earl of Sandwich from *Arte De Los Metales* (1st ed., Madrid, 1640). As ambassador to Spain, the Earl managed to obtain a copy of the suppressed Spanish original of Barba's important text on mining and metallurgy in the New World. He translated the first two of the five books, and had them published as two separate volumes. Unfortunately, the translator lacked technical knowledge, and the text is considerably flawed. None the less, it was this translation that was reprinted several times and used as the foundation for the German and French editions.

English, 1923: *El Arte De Los Metales* | (Metallurgy) | Translated from the Spanish of | Alvaro Alonzo Barba | By | Ross E. Douglass | And | E.P. Mathewson | New York | John Wiley & Sons, Inc. | London: Chapman & Hall, Limited | 1923. 8°: [i]-ix, [1], [1]-288 p., plates.

CONTENTS: [Plate: "Church of San Bernardo, Potosi

(Bolivia)...", verso facsimile reproduction of a Barba title page (odd c1770 edition)]; [i-ii], Title page, verso "Copyright, 1923."; iii-v, "Preface."; [vi], Blank.; vii-ix, "Table of Contents."; [1 pg], Blank.; [1]-276, Text of translation.; [277]-288, "Index."

SCARCE. English translation by Ross E. Douglass and E.P. Mathewson of the *El Arte De Los Metales* (Madrid, 1729). "Our aim has been to reproduce faithfully the phraseology of the author" (Preface). This is the only English translation of Barba's complete text. The 1670 translation was only of the first two books and is of little value since the Earl of Sandwich lacked technical knowledge.

Mountagu Edward, First Earl of Sandwich. (BORN: 1625; DIED: 1672) *English nobility & ambassador*. Sandwich was an admiral and general at sea, who distinguished himself at Naseby and the storming of Bristol in 1645. He resigned his command in 1659, but was reappointed in 1660. He sailed to Holland to convey Charles II to England. He was created Earl of Sandwich in 1660. He negotiated the marriage between Charles II and Catherine of Braganza, receiving the surrender of Tangier and conducting the queen to England in 1661. In 1666, he was appointed ambassador extraordinary to Madrid, where he successfully concluded a treaty with Spain. He was second in command of the fleet at the outbreak of war with the Dutch in 1672, and was subsequently blown up with his ship, when the fleet was surprised at Solebay. His body is buried at Westminster Abbey.

RARE. This popular book is here reprinted from the first English edition of 1670 with new title pages to both volumes, which are usually found bound together in this edition.

Although Duveen, amongst other bibliographers, calls this edition 'the first complete edition of the Earl of Sandwich's translation of the first American book on metallurgy', it is the second edition in English, the rarer issue with a collective title for both parts, instead of a title announcing the first book. It first appeared in English

ART OF METALS, 1674

in 1670, with the same collation, also printed by Mearne, having been published first in Spanish in 1640.

SCARCE. This is a collection of three separate treatises concerned with mineralogy, mining and metallurgy that had each previously been separately published. The first edition of this collected edition was published in 1738. In 1739 and again in 1740, to meet public demand, the work was again reissued. Although not indicated in the text, chapters 1-60 are a translation of the first two parts of Barbas treatise and chapters 61-72 are a reprint of Plattes work.

[A]. Alvaro Alonso Barba. In 1640, the *Arte De Los Metales* was published at Madrid in a very small edition. It is the first description of the silver mines, minerals and metallurgical processes of the New World, primarily in the area of Bolivia and Peru. Contained therein are descriptions of how the rich veins formed and their look, taste and smell. Various properties of metals and stones are discussed together with observations on how other veins might be located, most particularly gold and silver. Copper, iron, lead, tin, mercury are also described. The work then goes into the various methods for the refining of the ores to pure metals, including the importance of sorting, grinding, roasting, and fluxes used when heating. The most important observation is Barbas announcement of a process for the extraction of gold, silver and copper by boiling ore with salt solution and mercury in a copper vessel. This was a discovery that allowed the mines of the New World to operate with greater efficiency in filling the Spanish treasury.

The Spanish government considered any publication dealing with the New World to be a state secret—Barbas work especially so, since it dealt with the mineral wealth. Consequently, to keep the secret better, the first edition of 1640 was printed in a very small edition. In addition, the penalty for the unauthorized sale of a copy of Barbas 1640 work was a certain and painful death by the Inquisition. However, this did not stop the Earl of Sandwich from smuggling a copy out of Spain, and publishing the first English edition in 1670. Probably since the English Crown did not want to provoke a diplomatic incident with Spain, this English edition was also published in a small number. It was not until the translation of Barbas work appeared in these collected editions, that it became available to a large readership.

[B]. **Gabriel Plattes**. *Plattes work, A Discovery of all Sorts of Mines from Gold to Coal* was originally published as a very rare separate book in London in 1639 under the title, *A Discovery of Subterranean Treasure, viz. Of all manner of Mines and Minerals, from Gold to the Coale*. However, it is far more common to find it bound within an edition of these collected works. It is an interesting treatise on mineralogy, and considered the first useful text in English on metallurgical matters. The short tract contains a wealth of factual information illustrated by the authors own experiments. The work also is interesting for its account of the gold and silver mines in New England, Virginia and the Bermudas, as well as other parts of America. Besides dealing in great detail with assaying, the author provides a recipe by which he claims to have produced pure gold, but at a cost greater than the value obtained. One chapter is devoted to all kinds of vegetable dyes, which Plattes preferred to mineral dyes.

[C]. **Thomas Houghton**. First published in 1681 under the title, *Rara Avis in Terris: or, the Com-pleat Miner*, this work was reprinted as an independent entity several times before it appeared in this collected edition. This book is important as the first published statement on English mining laws and customs as used by the lead miners in Derbyshire. Houghton claims of the second book, "the art of dialling and levelling grooves, a thing greatly desired by all miners, being a subject never before written by any." A dictionary clarifying mining terms is appended.

Reissue, 1739: *A collection of scarce and valuable Treatises upon Metals, Mines, and Minerals ... Part I. and II. Containing the Art of Metals, Written originally in Spanish. By ... Alvaro Alonso Barba, Director of Mines at Potasi, in the Spanish West-Indies. Translated by the Earl of Sandwich, in the year 1669. Part III. Containing that Invaluable Piece of Mr. G. Plattes, viz. A Discovery of all Sorts of Mines from Gold to Coal. Part IV. Houghton's Compleat Miner.* London, 1739. 8°: xii, 215, [4], [66] p., illust., one plate.

Gabriel Plattes. (BORN: 1600?; DIED: London, England, 1655?) *English scientist*. Practically nothing is known of Plattes. He is thought to be of Dutch extraction, and he was an author on agricultural subjects. His notable work on the subject is *A Discovery of Infinite Treasure* (London, 1639). He was an original thinker and thorough scientist, who insisted on practical experimentation to confirm hypothesis. Though described as the "original genius in husbandry," he was neglected in his lifetime. Despite his poverty, he refused to beg for money and eventually died of starvation. His body was found in the street.

Thomas Houghton. (BORN: ; DIED:) *English author*. An English writer on mining and legal matters.

RARE. Translation from Barba's text contained
in *A Collection of Scarce and Valuable Treatises
upon Metals, Mines, and Minerals* (London, 1740).
This is the earliest work on mining and minerals
published at a colonial American press, and as such
has interest as the earliest known book on mining,
metallurgy and mineralogy published in the land that
would become The United States of America. In this
instance, the book was published at the famous press
of Ephrata, Pennsylvania, known as the Brudershaft,
which operated in 1763, and published only two works.
The text consists of two parts. The second, has its own
title page: "Das zweyte Buch, von den Metallen, darin
gelehrt wird der gemeine Weg, wie man das Silber durch
quecksilber reiniget: dazu etliche neue Regeln gefügt sid
darin gedachte Arbeit mehr erläutert wird."

300. — French, 1751.

Metallurgie, ou L'art de tirer et de purifier les métaux, traduite de l'Espagnol d'Alphonse Barba avec les dissertations les plus rares sur les mines & les opérations métalliques ... Paris, Chez Pierre-

Alexandre le Prieure, 1751.

2 vols. [VOL 1] 8°: xlv, 456, [16] p., one folding plate. [VOL 2] 8°: [10], 456, [20] p., one folding plate.

SCARCE. Translated by Nicole Lenglet du Fresnoy [see note below] from *Arte de los Metales* (2nd ed., Madrid, 1729), with the dedicatory epistle signed: Gosford (Lenglet Dufresnoy's pseudonym). Also included are translations and reprints of many treatises concerning mining, minerals and metallurgy. Several of the treatises were excerpted, according to their citations, from the *Philosophical Transactions* of the Royal Society, 1665-1678. Others, also with citations, first appeared in *Mémoires de l'Académie des Sciences*, 1701-1719 and in *Histoire de l'Académie*, 1727-1728.

TREATISES CONTAINED IN THESE VOLUMES ARE: Alvaro Alonso Barba, *Traité de Metallurgie and Liste des Mines du Perou*. — Bernardo de Vargas, *Extraits sur l'Art Métallique*. — Alonso Carrillo Laso de la Vega, *Description abrégée des Anciennes Mines d'Espagne*. — Sieur de Malus, *Avis des Riches Mines d'Or & d'Argent, & de toutes Especes de Metaux & Mineraux des Monts-Pyrénées*. — Martine de Bertereau, Baroness de Beau Soleil, *Veritable declaration ... des Riches & inestimables thresors, Nouvellement découverts dans le Royaume de France. La Restitution de Pluton*. — Guillaume Granger, *Paradoxe que les Metaux out vie*. — Charles de Bourgueville, Sieur de Bras, *Extrait des Recherches & Antiquités de la ville de Caen*. — Césaire d'Arcons, *Extrait du Livre sur le flux & reflux de la Mer and Extrait de la Relation d'un gentil-homme Anglois sur un Mineral semblable à de l'Or battu en feüilles, trouvé au Mexique*. — Edward Browne, *Relation ... touchant les mines de Hongri, Transylvanie & Autriche and Description des Mines de Mercure de Frioul and Description des Mines des Diamants présentée ... par le grand Maréchal d'Angleterre*. — Christopher Merret, *Relation des Mines d'étain de Cornouaille en Angleterre*. — Antoine de Jussieu, *Observations sur ce qui se Pratique aux Mines d'Almaden en Espagne, pour en tirer le Mercure*. — René Antoine Ferchault de Réaumur, *Essais de l'Histoire des Rivières & ruisseaux du Royaume qui coulent des Paillettes d'Or*. — Guillaume Homberg, *Remarques sur le raffinage de l'Argent. Observation sur une séparation de l'Or d'avec l'Argent par la Fonte*. — Charles François de Cisternay Du Fay, *Observation sur l'Or*. — Antoine Amand, *Méthode pour révivifier l'eau forte donnée à M. Du Fay and Opérations diverses pour la fonte et Purification des Metaux et Mineraux*. — Joseph Chambon, *Observations sur les Mines de Mercure, d'Or & d'Argent*.

Another issue, 1752: *Metallurgie ou l'art de tirer et de purifier les métaux. Traduite de l'Espagnol, avec les dissertations les plus rares sur les mines & les opérations métalliques par d'Alphonse Barba ...* La Haye, de Hondt, 1752. 2 vols. Reissue of the 1751 translation by Lenglet DuFresnoy.

Nicole Lenglet Du Fresnoy. (BORN: Beauvais, France, 5 October 1674; DIED: Paris, France, 15 or 16 January 1755) *French theologian & author*. Lenglet was a longtime secretary to the ruler of Köln, Clemens von Bavaria. After his retirement he lived in the Hague, Vienna and other cities before returning to his native France.

TABOAS MINERALOGICAS, 1823

302. — Portuguese, 1823.

Taboas | Mineralogicas. | [ornament] | Coimbra, | Na Real Imprensa Da Universidade. | [ornate rule] | 1823.

Oblong 4°: π^2 1-34 [98 folding tables numbered I-XCVIII] 574; 18ℓ.; [4], [1]-24 p., 98 folding tables, [I]-VIII p. PAGE SIZE: 212 x 258 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [1 pg], "Ao Leitor."—signed Manuel José Barjona.; [1 pg], "Tab. III. Columna Transparencia."; [1]-24, "Prolegomenos."; [98 folding tables]; [I]-VIII, "Index."

VERY RARE. In the preface the author explains his interest is to place before his readers a tabular method to explain the science of mineralogy. After a preliminary introduction, a series of ninety-eight tables are used to set out the names and properties of hundreds of mineral species arranged in a classification. An index at the end allows easy lookup of individual species.

Second edition, 1835: *Taboas Mineralogicas ... Segunda edição*. Coimbra, 1835. 4°: 256 p.

RARE. Descriptions of the fauna, flora and minerals of French Guiana. The first part is devoted to plants, the second part to animals and minerals of which pp. 121-148 concern birds, pp. 149-168 quadrupeds and reptiles, pp. 169-182 fishes, pp. 183-189 shells, pp. 190-209 insects, pp. 210-215 minerals. Wood 221. "The species are grouped in genera arranged alphabetically. Since the book is pre-Linnean, none of the names are tenable, but the descriptions often form the basis for names afterwards applied by Linné. The work is rare." (Zimmer I, 40). Pierre Barrère (1690-1755) was a French naturalist from Perpignan. In 1722 he went to French Guiana where he stayed 3 years. After his return he became professor of botany in his home town.

305. — French, 1743 [First edition].

Nouvelle | relation | de la | France Equinoxiale, | contenant | La Description des Côtes de la Guiane; de | l'Isle de Cayenne; le Commerce de cette | Colonie; les divers changemens arrivés | dans ce Pays; & les Murs & Coutumes | des différens Peuples Sauvages qui l'ha- | bitent. | Avec | Des Figures dessinées sur les lieux. | Par Pierre Barrere, Correspondant de | l'Académie Royale des Sciences de Paris, Docteur & | Professeur en Médecine dans l'Université de Perpi- | gnan, Médecin de l'Hôpital Militaire de la même | Ville, ci-devant Médecin-Botaniste du Roi dans l'Isle | de Cayenne. | [Orn.] | A Paris, | [Next three lines braced on the left-hand side by:] Chez { Piget, Quai des Augustins, à St. Jacques. | Chez | Damonneville, Quai des Augustins, à St. | Etienne. | Durand, rue St. Jacques, au Griffon. | M. DCC. XLIII.

12^o: π^4 A-V8/4 X7; 132 ℓ .; [4], [i]-iv, 1-250, [2] p., 17 engraved folding plates, 2 engraved folding maps. PAGE SIZE: 158 X 94 mm.

CONTENTS: [2 pgs], Half title page, verso blank.; [2 pgs], Title page, verso blank.; [i]-iv, "Avertissement.;" 1-240, Text.; 241-250, "Table Des Matières.;" [1 pg], Privilege and colophon.; [1 pg], Blank.

VERY SCARCE. The author set off for Guiana at the end of the year 1721 and left in 1724. He explored the rivers Kourou and the Orapouss while studying flora and fauna and the customs of the inhabitants. The work also deals with sugar trade and with the Negro slaves and the various native tribes and includes details on the commerce and trade. This is the first important work on Guiana and formed the major source of the 18th century knowledge. It is distinct from the author's *Essai sur l'Histoire Naturelle de la France Equinoxiale* and is not another edition thereof. Although interesting in many subjects, this appears to have little of interest to mineralogy.

RARE. Barrère made a special study of the origin and formation of figured stones (i.e., fossils) that he had discovered in the Pyrenées. This work contains his insightful observations. For example Barrère supposes that the reason fossil shells are found on the tops of the highest Alps and the rocks of the Pyrenées is because the land had formerly formed a basin in a great ancient sea. The two engraved plates show good depictions of figured stones and fossils.

308. — English, 1897.

A Description | Of | Minerals Of Commercial Value. | A Practical Reference-book for the Miner, Prospector, and Business Man, or | any Person who may be interested in the Extraction or Treatment | of the Various Metallic or Non-metallic Minerals, and for | Students either in Field-work or in the Laboratory. | By | D.M. Barringer, A.M., LL.B., | One of the Authors of "The Law of Mines and Mining in the United States." | First Edition. | First Thousand. | New York: | John Wiley & Sons. | London: Chapman & Hall, Limited. | 1897.

Oblong 8°: [2], [1]-168 p. Tables printed in red and black. PAGE SIZE: 126 x 210 mm.

CONTENTS: [1 pg], Blank.; [1 pg], "By the same author ..."; [1-2], Title page, verso "Copyright, 1897, | ..."; 3-4, "Preface."—signed D.M. Barringer, June 1897.; 5-17, Text of part one.; [18], Blank.; [19], "Part II. | I.—Tables."; 20-155, Text of tables.; 156-157, "Classification Of Minerals | (After Brush)."; 158-161, "III.—Appendix."; [162], Blank.; 163-168, "IV.—Index To Tables."

SCARCE. This work was intended as a reference book for those practically interested in minerals, especially miners, prospectors, or students in the field. In addition to some preliminary matter of a general nature, it consists for the most part of a series of tables giving the prominent metals in alphabetical order, with the name of the important ores, and for each the prominent physical and chemical characters, arranged very clearly in tabular format.

VERY SCARCE. Published as one of Gasc's *Cours d'Études Rationnelles*, this derivative mineralogy provides a competent and reasonably comprehensive textbook of the science. The first part describes basic information on the science, such as definitions, an overview of the physical properties, chemical compositions, etc., while the bulk of the text is given over to a descriptions of individual mineral species. An alphabetical list of minerals known to occur throughout France occupies pages 379-447.

Reissue, 1843: *Cours Élémentaire de Géologie, Minéralogie et Géognosie, suivi d'une Statistique Minéralogique des Départements*. Paris, Aimé André, 1843. 8°: [3], [1], [i]-xii, [1]-480 p., 6 engraved plates. The same text as the 1839 edition with a new title page.

CASPER BARTHOLIN

BARTHOLIN (Berthelsen), Casper. (BORN: Malmö, Schonen, Denmark [now Sweden], 12 February 1585; DIED: Sorø, Denmark, 13 July 1629) *Danish physician.*

Bartholin was the father of both Thomas and Erasmus. He was educated at Universities of Copenhagen, Rostock and Wittenberg in Germany. After graduation he established a medical practice in Wittenburg. Bartholin was appointed a professor eloquence, than of medicine at the University of Copenhagen, 1613–24. He also accepted a post as rector of the University in 1618.

ErasmI Bartholini | D. & P.P. | De | Figura | Nivis | Dissertatio. | [rule] | Hafniæ, | Typis Matthiæ Godicchii, | Sumptibus P. Hauboldi | Anno cD LXXI.

8°: a-c8; 24ℓ.; [6], [1]-42 p., one plate.

CONTENTS: [2 pgs/=[a1](#)], Title page, verso blank; [4 pgs/=[a2r-a3v](#)], Dedication.; [Full page diagram showing how circles pack.]; [1]-42 (=a4r-c8v), Text.

VERY RARE. This is Bartholin's work treatise on the shape of ice crystals which speculates on the internal structure of snow crystals. This work has sometimes incorrectly been called the earliest treatise on crystallography, because it precedes Boyles work on gems by eleven years. However, Kepler's *Sterna Seu De Niue Sexangula* (Francofurti, 1611), which also discusses the shape of snow crystals, is much earlier still.

Included with Thomas Bartholin's 1661 work: Thomæ Bartholini | De | Nivis | Usu Medico | Observationes variæ. | Accessit | D. Erasmi Bartholini | De Figura Nivis | Dissertatio; | cum | Operum Authoris Catalogo. | [ornament] | [rule] | Hafniæ, | Typis Matthiæ Godicchii, | Sumptibus Petri Haubold, Bibl. | cD LXXI. 8°: [24], 232, [8]; [6], 42, [16] p. one engraved plate. Title page in red and black.

Rare. This is the first work after Avicenna to discuss refrigeration anesthesia. The Neapolitan surgeon Marco Aureliano Severino [1580-1656] reintroduced the use of snow and ice as an anesthetic agent in the seventeenth century, and his pupil Bartholin described Severino's methods in this work. Refrigeration anesthesia was employed successfully in amputations as late as the nineteenth century. Added to Bartholin's work is a treatise on the shape of ice crystals written by his younger brother Erasmus. Also included in this work is a bibliography of Thomas Bartholin's published works.

CONTENTS: [2 pgs], Title page, verso blank.; [2 pgs], Dedication.; 1-60, Text.

VERY RARE. *Experimenta Crystalli Islandici* is the first published study in crystal optics, which also first described double refraction and contradicted the Newtonian theory of light which was presented at the

EXPERIMENTA CRYSTALLI ISLANDICI, 1669

same time. The work essentially describes a wide range of experiments performed on Iceland spar, a variety of the mineral calcite. Beginning with descriptions of the rhombohedral shape of the crystals, and noting that any pieces broken from a specimen are also rhombohedral, the author continues his experiments to define the physical characteristics of the specimens. Included among these are observations of its relative hardness, of its tendency toward cleavage, of its ease of decomposition when treated with acid, and of its ability to hold an electric charge when rubbed or heated. The remainder of the book describes Bartholin's discovery of double refraction, i.e. the physical property of Iceland spar (and other substances) to split light rays such that two images are seen when an object is viewed through the crystal. The author questions the character of double refraction, including its behavior when the crystal is turned, its angle of refraction and its existence in other substances. Bartholin then postulates a theory to explain the phenomena, which is based on pairs of pores, existing along cleavage planes inside the crystal, reflecting "corpuscula" of light at different angles.

Abridged English transl., 1671: Henry Oldenburg [see note below], secretary of the Royal Society of London, set about writing a translation of Bartholin's work. It was published as: "An Accompt of sundry Experiments made and communicated by the Learned Mathematician, Dr. Erasmus Bartholin, upon a crystal like Body sent to him out of Island" (see: *Philosophical Transactions of the Royal Society of London*, 6 (1671), no. 67, 2039-48).

English, 1991: *Experiments on birefringent Icelandic crystal. with a facsimile of the original publication 1669. Erasmus Bartholin.* Translated by Thomas Archibald. Introduction by Jed Z. Buchwald and Kurt Möller Pedersen ... Copenhagen. Danish National Library of Science and Medicine. 1991. Published as: *Acta Historica Scientiarum Naturalium et Medicinalium*, vol. 40. Includes bibliography.

Henry Oldenburg. (BORN: Bremen, Gernay, c1618; DIED: Charlton, near Greenwich, England, 5 September 1677) *English scientist.* Oldenburg graduated from the University of Utrecht in 1641, and he matriculated at Oxford from 1657 to 1658. He taught in the Paedagogium of Bremen. Later he became a professor in the newly established University of Dorpat, in what is now Estonia. Although it is known that Oldenburg matriculated in the University of Utrecht in 1641, nothing is known with assurance about what he did during the following twelve years, but there is presumptive evidence that he was a tutor during these years. In 1656 he became tutor to Boyle's nephew, Richard Jones, later the third Viscount Ranelagh and first Earl of Ranelagh. Oldenburg made a profession of scientific administration. He founded a system of records in the Royal Society that is still followed, created an international correspondence of scientists, and founded the first scientific journal, *The Philosophical Transactions of the Royal Society of London*. Oldenburg began publishing in 1665 the *Philosophical Transactions*, which were his personal enterprise, to make money, although he never made as much as he hoped. He also translated papers for the *London Gazette*. He also translated and published works from abroad. He translated at least two of Boyle's works into Latin, and he appears to have functioned effectively as the publisher for a number of Boyle's works.

Karl Mieleitner. (BORN: Munich, Bavaria, Germany, 31 March 1890; DIED: Munich, Bavaria, Germany, 15 March 1923) *German mineralogist & historian of mineralogy.* Born the son of a shoemaker, Mieleitner became in 1913 assistant for the Bavarian state mineral collection at the University of Munich, where in 1919 he succeeded F. Grünlung as 'Konservator.' He was an enthusiastic and energetic worker, producing several papers within a few years. He developed an interest in the history of mineralogy and published before his early death German translations, with authoritative notes, of the old works of Steno, Bartholin and Cappeller.

BARTHOLOMAEUS ANGLICUS. (BORN: England, c1190; DIED: Magdeburg, Germany?, c1250) *English theologian & encyclopedia.*

An Englishman by birth he had been professor of theology at the University of Paris, when, in 1224 or 1225, he entered the newly established Order of St. Francis in company with his countryman and fellow-professor of theology, Haymo of Faversham, and two other professors of the same faculty. He continued his lectures at the claustral school until 1231, when he was sent to Magdeburg in Germany. There he took on the role as the new lector. Nothing definitive is known about the life of Bartholomæus after he left Paris in 1231. His life at Magdeburg was probably spent in teaching and reorganizing the Franciscan school there. The date of Bartholomæus' death is unknown, but it is thought that he died about the middle of the thirteenth century. He was formerly identified with a later Franciscan and Englishman, Bartholomæus of Glanvilla, or Glauvilla, who died about 1360, and to him the famous work *De Proprietatibus Rerum* was ascribed. Recent research places beyond doubt that the two men must be distinguished and that the authorship of the work in question must be attributed to the Magdeburg professor of 1231, and that the Glanville descriptor should be removed from his name.

capitulum bertholomei | anglici de proprietatibus reru; 248, Blank.

EDITIO PRINCEPS. Extremely rare. While older authorities give precedence to the Basel edition, printed by Ruppel, it can now be stated that this is the first printed edition of Bartholomæus, since the early manuscript dates found in two Ruppel books have been shown to be forgeries, and as it now seems that Ruppel did not begin printing in Basel until after 1472.

Besides being the first printed edition, this Cologne issue is important for its connection to William Caxton [see note below]. The Cologne city ledgers record that Caxton arrived in the city in July 1471 (Birch) to learn the process and art of printing. In 1471, Johann Veldener [see note below] chose Bartholomæus' encyclopedia as his first project, and accepted Caxton as his pupil. However, indications are that Caxton's role was considerably more important as a financier. "The necessary capital is more likely to have come from Caxton than Veldener who had only recently achieved independence by the establishment of his own printing office and who therefore would have been close to the limits of his financial capacity. Under these circumstances, would he have dared on his own to venture the publication of so large a book? There is the further possibility that Veldener got together the necessary funds by charging the Englishman for instruction in the art of printing" (Corsten). Thus this edition is the earliest example of Caxton's printing.

De Proprietatibus Rerum was the most popular

encyclopedia of the thirteenth century, which has been called the age of encyclopaedias. The intellectual renaissance of the preceding century had stimulated a desire for learning. It was impossible for a large number of students to acquire first hand knowledge of every science and the universities could not accommodate all those who wished to learn. Therefore some means of spreading knowledge was required. The problem was solved by writing encyclopaedias that collected together the opinions of the best known authorities. These works varied in comprehensiveness and arrangement, but the educational aim was never forgotten. These books were to be used as textbooks and works of references for the preachers and scholars that did not have access to a library and who could not afford to collect one of their own. In fact, Bartholomæus wrote his compilation primarily for the student of theology and for the preacher as he explains in the Prohemium.

De Proprietatibus Rerum was written as an ordered encyclopedia of all the sciences of the time: theology, philosophy, medicine, astronomy, chronology, zoology, botany, geography, mineralogy, are the subjects treated in this work. It is the first important encyclopedia written in the Middle Ages and the first in which the works of Greek, Arabian, and Jewish naturalists and medical writers, which had recently been translated from Arabic into Latin, were included as contributions. Aristotle, Hippocrates, Theophrastus, the Jew Isaac Medicus, the Arabian Haly, and other researchers are frequently quoted. Even in the age before mechanical printing, the *De Proprietatibus Rerum* enjoyed widespread popularity as is shown by the many dozens of manuscripts still in existence. In manuscript form, it was translated into five European languages: French, English, Spanish, Provençal and Italian. Thus, it had a widespread appeal to the general population and had a great influence on the curriculum of the medieval university.

Bartholomæus based the structure of his book on the *Etymologiarum Libri Duo* written by the learned theologian, ISIDORE OF SEVILLE between 623 A.D. and 633 A.D. The 20 sections found in Isidore are reduced and rearranged to 19 by Bartholomæus; however, he follows his own method in compiling the observations and adheres to the accepted medieval form of quoting ancient authorities. Sprinkled throughout the text are his own observations that give the *De Proprietatibus Rerum* a unique flavor.

The 19 books of Bartholomæus' text are ordered thusly: (1) God, (2) Angels and Demons, (3) Of the Soul and Reason, (4) Of the Body's Essences, (5) The Human Body and Each of its Parts, (6) The Ages of Man (Family Life and Household Economy), (7) Of Infirmities and Medicines, (8) Of the World and the Heavenly Bodies (Cosmology and Astrology), (9) Of Time and the Divisions of Time, (10) The Material, Form, and Properties of the Elements, (11) Of the Air and its Natural Phenomena (Meteorology), (12) Of Winged Creatures, (13) Of Waters and Fish, (14) Of the Earth and its Features, (15) Of its Provinces (Political

BARTHOLOMAEUS ANGLICUS

and Economic Geography), (16) Mineralogy, including precious and semiprecious stones, sand, coal, Bezoar stones, etc., (17) On Plants and Trees (A Herbal), (18) Of Animals, and (19) On Non-Essential Characteristics (i.e., Colors, Tastes, Odors, etc.), and a Miscellany on Food, Drink, Eggs, Weights and Measures, Music, and Musical Instruments. This ordering which can be classified into four distinct sections suggests that Bartholomæus carefully planned his work.

The order of the *De Proprietatibus Rerum* is founded on a medieval logic of progression. The first three books form the first section with God, as the supreme creator and the prime moving force, with angles, demons and the soul all occupying the first position. Next comes the second part (books 4-7) devoted to the important factors that affect the life of man. The third section (books 8-18) treats the universe and may be subdivided into two parts. The first (books 8-13) has as its subject the world in general while the second (books 14-18) describes the earth in particular, including in book 16 metals, stones and minerals. The fourth section is composed solely of the nineteenth book in which everything not previously discussed finds a place including colors, odors, liquids, weighs, measures, music, etc. Since this work was intended as a reference to show man's place in God's universe, the text provides examples of good and bad conduct, and illustrates for him the principals of Christianity.

Since the greatest importance was assigned to theological matters, it became fairly simple for Bartholomæus to ignore the accuracy of his descriptions. Hence we find him with no clear idea of the locations of Egypt or India, the latter being a vague term which medieval men used to refer to the vast territory that stretched beyond Arabia. Bartholomæus' own eyes would have told him that bees do not carry small stones to weight them against the wind, and that crabs do not employ stones to keep oyster shells propped open while they dine on the contents. It was as obvious then as now that the legs of a fox are not shorter on the right side, and that swiftly moving currents are not the cause of oars becoming disjointed in appearance when dipped under water. Yet we cannot blame him for being a man of his time.

William Caxton. (BORN: Tenderton, Kent, England, c1416; DIED: London, England, 1491) *English printer, translator & linguist.* Caxton was the first to print books in English. He served an apprenticeship as a mercer and about 1441 he relocated to Bruges and established a successful business there. In 1462 Caxton was selected governor of the Merchants Adventurers in the Low Countries, serving as a diplomat for the English king. He learned the art of printing in Cologne between 1471-2, and at Brugge in 1475 he and Colard Mansion printed *The Recuyell of the Histories of Troye*, his own translation from the French, and the first book printed in English. In 1476 he returned to England, and established the first English print shop at Westminster in 1477. There he printed *Dictes or Sayengis of the Philosophes*, the first dated book printed in England. Caxton is known to have printed about 100 books, many dealing with themes of chivalry. He was the translator, from French, Latin, and Dutch, of about one third of the books that he printed, and for some he wrote original prologues, epilogues, and additions. His books are of

superb craftsmanship and are carefully edited. One of the typefaces used by Caxton is the original Old English type. Wynkyn de Worde, his successor as a printer, was his assistant at Westminster.

Johann Veldener. (BORN: ; DIED: c1487) *Dutch printer.* Native of the Diocese of Würzburg, Veldener set up his first press in the town of Louvain in 1473. In 1478, he moved to Utrecht and reestablished his print shop there.

CONTENTS: Folios, 2r, "Incipit phemiū de p̄rietatibus reꝝ fratris | bartholomei anglici de ordine fratꝝ minoꝝ. | [C8]Vm proprietates rerum | sequantur substancias. ..." 218r, col. 1, "[T8]Abula huius insigni operis (quod de re | rū proprietatibus intitulat) incipit feli | citer ..."; 220r, col. 1, end: "zeugia xxiii."; 220v, Blank.

VERY RARE. Printed by Berthold Ruppel [see note below]. Some incunabula bibliographies believed this to be the first edition, however, recent studies have shown that it is instead a second edition [see the commentary on the previous entry].

Berthold Ruppel. (BORN: Hanau, Germany, ; DIED: 1494/5) *German printer.* Ruppel was the first printer in Basel. He published numerous works between 1460 and his death.

VERY RARE. Dutch translation probably commissioned and certainly printed by Jacob Bellaert [see note below]. This is the first Dutch edition of the famous encyclopedia, and the first of all the editions to contain illustrations.

Indications are that this production was designed from the start to be a sumptuous publication. For setting the text Bellaert used a beautiful, newly designed font in the Gothic style. Each of the eleven woodcut illustrations acts as a full-page frontispiece introducing the individual sections of Bartholomaeus text. Some of these plates serve for two sections by rather ingeniously incorporating isolated motifs laid against a broad, unifying landscape. For example, stones and gems are scattered here and there along the banks of a stream on the plate that also introduces the description of plants. These illustrations are finely detailed depictions by the anonymous artist whose woodcuts in this and other of Bellaert's books has earned him the descriptor: "The Bellaert Master." The book was issued on Christmas Eve 1485 ("op Kerstavont, 1485") making this volume comparable to the modern Christmas edition. Finally, it is the only book from the press of Bellaert that is signed in the colophon as being produced by his establishment. He was obviously and deservedly proud of this publication.

The eleven woodcuts each measure approximately 200 x 140 mm. and represent Solomon as judge, seated in the middle, before him the clerk of the court, to the left Belial as prosecutor and to the right Moses, Christ's counsel for the defense (11v); the creation of angels and fall of demons (18v); the creation of Eve and anatomical man (30v); the ages of man, a physician and a surgeon attending patients (105v); the earth and the spheres (161v); occupations of the months (188v); birds (217v); fishes (233v); a landscape showing a river and towns (247v), trees, plants, stones and gems (287v) and animals and reptiles (368v). In all 32 different woodblocks were cut, and printed in continually changing combinations.

Jacob Bellaert. (BORN: Zierikzee, The Netherlands, c1450; DIED:) Dutch printer. Bellaert was the first printer in Haarlem. His earliest book was published in Lijden in December 1483. An important part of the books he printed were the splendid woodcut illustrations. The only one of his works that is signed is his issue of Bartholomaeus Anglicus's *Van de proprieteiten der dinghen* (1485). In 1486 several other titles can be traced to him as well.

The fifteenth-century illustrators of books and woodcutters are veiled in still far greater anonymity than the printers at the time. Jacob Bellaert escaped from such anonymity by once including his name in a colophon. In art history he may now serve as the namegiver for the unknown

illustrator: the Bellaert master.

The illustration shows Solomon as judge, seated in the middle; before him the clerk of the court, to the left Belial as prosecutor and to the right Moses, Christ's counsel for the defence. Three woodblocks were used, one for the centre and two for the sidepieces. In all 32 different woodblocks were cut, and printed in continually changing combinations. For the illustrations in the Belial reprints of 1512 and 1516 by the Antwerp printer Hendrik Eckert van Homberch, Bellaert's woodblocks, then 30 years old, were used again.

VERY RARE. First printing of the Spanish translation done in 13?? by Vicente de Burgos [see note below]. The printer was Henricus Mayer [see note below] of Toulouse, and the work was completed on 18 September 1494.

First Spanish edition of the great encyclopedia of natural science compiled circa 1235 by the Franciscan Bartholomew from England, who taught theology at Paris and later at the school of his order at Magdeburg. The work is a summary of knowledge current among educated men of the Middle Ages. It is arranged by subject in 19 books (God and the angels, the soul, the human body, physical geography, mineralogy; fauna and flora; colors; odors, weight and measures, musical instruments, medicine etc...) and is much more extensive than any earlier books on the same subject. Especially the Geography chapter (Libro XV "Delas provincias") shows an advanced state of knowledge, describing 173 countries and provinces. "The political geography of Europe contains a quantity of information which had not been put together before." Sarton, II, 586.

This extremely rare incunable is illustrated with 18 large woodcuts, including one repeat and the arms of Castile and Aragon on title; woodcut printer's device at the end, 6 woodcut diagrams including a small T-map on leaf 179. The woodcuts include a depiction of physicians with a patient, people working in a mine, birds, a larger one of the zodiac etc... They appear to be very free copies of those in Mathias Huss' French editions of 1485 and 1491/92.

Vicente de Burgos. (BORN: ; DIED:) *Spanish jesuit*. Burgos lived in the second half of the fifteenth century, and was the Spanish translator of Bartholomaeus Anglicus.

Henricus Mayer. (BORN: ; DIED:) *Spanish printer*.

LIBRO DE PROPRIETATIBUS, 1529

357. Translation, 2nd edition, 1529: Libro de proprietatibus rerum in romance. | [Large woodcut vignette, consisting of a three by three matrix of smaller scenes related to topics in the text.] | Hystoria natural: do se tratã las propiedades de todas las cosas. | Es obra catholica & muy proueçosa: que cõtïene mucha doctrina de theologia: hablando | de Dios: & mucha filosofia moral & natural hablando de sus criaturas. Va acopañada de | grandes secretos de astrologia: mediina: cirugia: geometria: musica & cosmografia. Cõ | otras sciencias en. xx. libros siguientes. | [The following descriptions of the various books are arranged in three columns.] | ¶ Libro. j. dēdios & essencia. | El. iii. dios āgeles buẽs& malos | El. iii. del anima. | El. iii. õlos hũores y ciẽtos. | El. v. del hõbre y fus partes | El. vi. delas hedades | El. vii. delas eufermades | El. viii. õl cielo y mũdo & plaetas | [Column two starts:] El. nouens del tiempo. | El. x. dela materia & forma. | El.

Xylographic title repeated with the white on black wording, "Bartholomeu³ de | proprietatibz rerū."

VERY RARE. Translation by John Trevisa [see note below] of *De Proprietatibus Rerum* and printed from a manuscript copy by Wynkyn de Worde [see notes below]. The 19 woodcut illustrations in the text are based on those in the Dutch 1485 edition and various French editions published in Lyon.

This is the first English book printed entirely on paper made in England. The "chancery" size format was manufactured by John Tate (so credited in the colophon) at the first English mill established in the 1490's. In the nineteenth century a copy of Trevisa's manuscript was presented to the library at Columbia University by George Plimpton. It is described as an "English manuscript on vellum, of 388 leaves, England, circa 1440. It is John of Trevisa's translation of Bartholomaeus' comprehensive thirteenth century encyclopedia and bears printers' marks throughout, indicating that type was set from this copy for the first edition printed in England by Wynkyn de Worde in 1495."

John de Trevisa. (BORN: Crocadon, in St. Mellion, near Saltash, Cornwall, England, 1362; DIED: Berkeley, England, 1412) *English translator.* Trevisa was a fellow of Exeter College, Oxford from 1362 to 1369. Later he became a fellow of Queen's College, but was expelled in 1379 by the Archbishop of York for unworthiness. Prior to 1387, he entered into the service of Thomas, 4th Baron of Berkeley, as chaplain and vicar of Berkeley. Trevisa was not an original writer, but a diligent translator, whose works became the source for many English incunabulum.

Wynkyn de Worde. (BORN: Worth, Alsace, France, ; DIED: London, England?, 1534?) *French printer & stationer.* His real name was Jan van Wynkyn ('Worde' being merely a place name). As a young man, he came to England and was employed as an apprentice in the printing establishment of William Caxton. He probably accompanied Caxton to Bruges in 1476. In 1491, after Caxton's death, Wynkyn took over the printing business in Westminster. Between 1493 and 1500, Wynkyn issued at least 110 different works. This remarkable output continued until his death making his press more prolific than any other printer in operation before 1600.

Stephen Batman. (BORN: ; DIED: Leedes, Kent, England?, 1584) *English theologian.* Batman attended Cambridge where he gained a reputation as a learned man and an excellent preacher. After graduation, he was selected by the Archbishop as a domestic chaplain, and employed him in collection of the library of Corpus Christi College, Cambridge. In 1573, he was appointed rector of Merstham in Surrey. In 1582 he was one of the domestic chaplains of Henry Cary, Lord Hunsdon. He resided for some time at Leedes, in Kent.

Lectures | in | Natural Philosophy, | Designed, | To be a foundation, for reasoning pertinently, | upon the | Petrifications, Gems, Crystals, | and | Sanative Quality | of | Lough Neagh in Ireland; | And intended to be | An Introduction, to the Natural History | of | Several Counties contiguous to that Lake, | Particularly | The County of Ardmagh. | [rule] | By Richard Barton,

B.D. Author of the Analogy of Divine Wis- | dom, in the Material, Sensitive, Moral, Civil, and Spiritual System of Things. | [rule] | [...9 lines of Latin quotation...] | [rule] | Dublin: | Printed for the Author, by A. Reilly, and fold by George and Alexander | Ewing, at the Angel and Bible in Dame-street. M,DCC,LI.

4°: π^4 B⁸ C-Z⁴ Aa-Bb⁴ Cc²; ℓ ; [i]-xvi, [10], [1]-209, [1] p., 6 engraved plates (3 folding), one map, illus. PAGE SIZE: 280 x 210 mm.

CONTENTS: [i-ii], Title page, verso blank.; [iii], Dedication, signed Richard Barton.; [iv], Blank.; [v]-xvi, "The | Author | His friendly Address | To His | Countrymen."; [8 pgs], "A | List | Of the Names of | Subscribers."; [1 pg], Sectional title page.; [1 pg], Blank.; [1]-209, Text.; [1 pg], "...Some Remarks..."

PLATES: Plates consist of: Frontispiece, A Prespective View of Lough Neagh. Pl. 2, Geometric figures (folding). 3-4, Geological specimens. 5, Map (folding). 6, Mineral specimens (folding). 7, Fossil shells.

VERY SCARCE. Essentially a series of lectures on the natural history and geology of Ardmagh county, Ireland. But, in the style of the day, the author has attempted to cast it into the Newtonian mold of propositions, demonstrations, and lemmas, thus to give it a more 'mathematical' air. Most of the lectures are centered on the geology, mining and mineralogy of the region, and thus provide an interesting 18th century perspective.

BASILIVS VALENTINUS

BASILIVS VALENTINUS.

Supposed Benedictine monk of the fourteenth century, but no trace of him has ever been found in the monasteries of Germany, where he supposedly worked. Current research suggests that this name is more likely a pseudonym for JOHANN THÖLDE, who wrote the *Haligraphia* in 1603, a work on the mineralogy and economy of salt.

REFERENCES: Partington, *History of Chemistry*, 1961-70: 2, p. 183-203. • Poggendorff: 1, cols. 112-3.

367. — German, 1604 [First edition].

Triumph Wagen Antimonii Allen / so den grund suchen der uhralten Medicin/ Auch zu der Hermetischen Philosphey beliebnis tragen / Zu gut publiciret / und an Tag geben / Durch Johann Thölden. Mit einer Vorrede/ Doctoris Joachimi Tanckii. ... Leipzig, In verlegung Jacob Apels. Druckts Jacob Popporeich. 1604.

8°: [44], 694 (i.e., 622), [29] p. Pages 608-622 incorrectly numbered 680-694; other errors in paging. Title page in red and black.

RARE. In the *Triumph Wagen Antimonii*, the author made the first detailed description of antimony and its compounds (preparation of antimony trioxide).

This work brings together many facts and speculations on the chemistry of antimony, its combinations and its use in medicine. The descriptions of the preparations of the various compounds are written in a clear style. The book also contains translations of the works of Bacon, Rodocher and Issacus Hollandus. Many chemical preparations of the first importance are described in this work, and Basilius Valentinus has been hailed as the Father of Modern Chemistry. In his honor the mineral valentinite, an antimony oxide, was named in the nineteenth century.

The book contains the following treatises, which are followed by an index: 1. Triumph Wagen Antimonii, Fratriv Basiliiv Valentini (p. 1-264). 2. Von der Tinctur oder Oleo Stibii, Rogeri Baconis Angli (p. 265-296). 3. Von den Particular und Universal Tincturen (p. 297-397). 4. Vom Stein der Weisen; Theorica unnd Practica Georgii Phædronis Rodocheri (p. 399-450). 5. Der uhralter Ritterkrieg (p. 451-476). 6. Opus Saturni Isaaci Hollandi (p. 477-523). 7. Philosophisch Betrachtung, von der materia Lapidis und seiner Bereitung (p. 525-574). 8. De occulta philosophia chemicorum (p. 577-694, i.e., 622).

Basil Valentine, his Triumphant chariot of antimony, with annotations of Theodore Kirkringius. M.D. With The true book of the learned Synesius, a Greek abbot, taken out of the emperour's library, concerning the philosopher's stone. London, D. Newman, 1678.

12°: [18], 1-160 p. [2], 163-176 p. "The true book" has special t.-p. "The true book" has special t.-p. Illustrated with 5 engraved plates, showing chemical vessels, retorts etc. PAGE SIZE: 175 x 105 mm.

RARE. This translation (the second in English) of Valentine's famous treatise was made by Richard Russell, who translated several alchemical works in the 17th Century. It was first published in 1604 and is regarded as one of the earliest monographs on a chemical element ... there is no doubt but that his treatise brought together into one volume the facts of the chemistry of antimony and its combinations, and its uses in medicine in a form that made his book the standard work on that subject for many decades. The work is, in far as its chemistry is concerned, clear and comprehensible for its time.

BATSCH

BATSCH, August Johann Georg Carl. (BORN: Jena, Germany, 28 October 1761; DIED: Jena, Germany, 29 September 1802) *German botanist & naturalist*.

Batsch attended the University of Jena, being awarded an M.D. Subsequently, he became a professor of natural history at the University, later taking on the rôle of professor of medicine and philosophy. He researched fungi, and created an system of classification for domestic plants in 78 families and 9 classes.

381. — German, 1785 [Collection catalog].

Verzeichniß | der | Gräfflich Reuß-Plauischen | Naturaliensammlung | zu Köstritz. | [ornament] | [rule] | Gera, | gedruckt bey Heinrich Gottlieb Rothen. | 1785.

2 parts. [Part 1] 8°:)(3, A-U8 X3 [no quire W]; 162 *l.*; [6], [1]-325, [1] p. [Part 2] 8°: [not seen].

CONTENTS: [2 pgs], Title page, verso blank.; [4 pgs], "Vorbericht."; [1]-325, Text.

VERY RARE. Although this title was published anonymously, authorship is generally attributed to

BATSCH

Batsch. This is a catalog of Count Heinrich Reuss-Plauen XXVI's [1725-1796] natural history cabinet located at Köstritz (now in Thuringia, Germany) which was issued in 2 parts in 1785. The first part lists only shells and other marine animals. The preface unsigned preface by Batsch outlines the mineralogical portion that is contained in the second part together with descriptions of butterflies and other insects. It is arranged on a system founded on Wallerius and contains precious and semiprecious stones, marbles, jaspers, Labradorite, alabaster, petrified wood, etc. [Entry by Andreas Mueller]

384. — German, 1796.

Versuch | einer | Mineralogie | für | Vorlesungen | und | für anfangende Sammler von Mineralien | entworfen | [tapered rule] | A.I.G.C. Batsch | Professor zu Iena. | [tapered rule] | Iena und Leipzig, bey Christian Ernst Gabler. | 1796.

8°: *8 A-Z⁸ Aa-Ee⁸ Ff⁴; 234ℓ.; [16], [1]-452 p. PAGE SIZE: 204 x 116 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [1 pg], Dedication to Christian Gottlob Voigt.; [1 pg], Blank.; [4 pgs], "Vorerinnerung."—dated 4 October 1795.; [8 pgs], "Inhaltsanzeige."; [1]-436, Text.; [437]-452, "Register."

RARE. This is an explanation of the author's valuable mineralogical system, fully annotated, and including descriptions of the mineral species. Odd for the time, Batsch has included in many instances a chemical analysis of the mineral in question. The book is dedicated to JOHANN CARL WILHELM VOIGT, a close friend of the author.

TEXT-BOOK, 1881

Text-Book | Of | Systematic Mineralogy | By | Hilary Bauerman, F.G.S. | Associate of the Royal School of Mines | London | Longmans, Green, and Co. | 1881 | All rights reserved.

8°: π^4 B-Z⁸ Aa⁸; 188 ℓ .; [i]-vi, [2], [1]-367, [1] p., text illus. PAGE SIZE: 170 x 110 mm.

CONTENTS: [i-ii], Half title page, verso blank (missing from copies examined).; [iii-iv], Title page, verso blank.; [v]-vi, "Preface."—dated 10 January 1881.; [1 pg], "Contents."; [1 pg], Blank.; [1]-362, Text.; [363]-367, "Index."; [1 pg], Blank.

SCARCE. One from the series of the *Text-Books of Science*. The author designed the text around two principles. First that it should be a useful guide to students wishing to acquire a flavor of the subject and second, to serve as an elementary introduction to more comprehensive textbooks on the subject, such as Dana, Des Cloizeaux, and Miller. Bauerman has been guided by Groth's *Physikalische Krystallographie* (Leipzig, 1876) and Rammelsberg's *Handbuch der Mineralchemie* (Leipzig, 1875) in his descriptions, while utilizing the crystallographic notation of Miller.

VERY RARE. This is an early treatise describing the bezoar of mystical and medical properties of calculi formed in the kidneys and guts of various animals. Such stones and similar animal calculi were the subject of intense interest from Classical times due to their supposed property as an antidote to poison or as an ingredient in various medical preparations. Bauhinus' treatise is one of the earliest to treat the subject and it is replete with mystical suppositions and historical notes. Its 46 chapters provide descriptions and discussions of the various specimen types as well as methods for determining real stones from imitations. Throughout the author has included considerable historical information, especially in reference to these stones used as medical remedies and antidotes.

DE LAPIDIS BEZAARIS ORIENTAL, 1625

JOANNES BAUHIN

Of French Protestant ancestry, Bauhin was born to parents exiled in Basel, Switzerland. He was educated in Basel under the exiled Italian religious reformer Coelius Curione [1503-1569] and in Zurich under the famous Swiss naturalist CONRAD GESNER. From 1560 to 1563, after completing his studies, Bauhin made an extensive trip throughout Europe, afterward settling in Lyons, France, where he established a medical practice. In 1568, he was forced to flee back to Switzerland when a wave of religious persecution swept France, but in 1571 he was appointed physician Duke Frederick, ruler of Württemberg and Montbéliard. He built extensive botanical gardens, and collected minerals in the Alps with Gesner and others.

[2 pgs], Blanks.; [6 pgs], "Paralipomena." [=mushrooms & fungi]; [2 pgs], Blanks.; [6 pgs], "Encomiwm | Fontis Bollensis | ..." [=commendatory verses]; [2 pgs], Blanks.

VERY RARE. *Historia Novi et Admirabilis* comprises four books, of which the first three provide a description of the medicinal virtues of European mineral waters and baths, based on the study of the springs at Bad Boll, near Gropingen, Württemberg. It is one of the first illustrated books on minerals, gems and also contains an early record of cultivated fruit with a series of early illustrations. This was also the most detailed work on the subject of balneology written in the sixteenth century, and it became Bauhin's most popular treatise. The fourth book, written almost like an appendix, is much more unusual in covering the local natural history in considerable detail. It utilizes fine woodcuts to illustrate the descriptions, and these comprise 210 of fossils and minerals, 60 of apples, 41 of pears, 2 of plants and 16 of insects, making this one of the very few illustrated works concerning mineralogy printed in the sixteenth century. After the main part of text, there follows a *Paralipomena*, with 11 woodcuts, including 7 of fungi, and 2 which perhaps show the preparation of flax. Finally, the text includes 3 leaves

of commendatory verses. In the first part, Bauhin has included a list of authorities that are cited in the text. Among these are several works authored by CONRAD GESNER, whose mineralogical work perhaps inspired Bauhin to prepare this exceptional illustrated mineralogy.

Unknown to most bibliographers is that there are several issues of the first edition. The presumed first issue was published with a portrait of Bauhin printed on the verso of the title page. This beautiful renaissance portrait shows the author with a plant in his right hand and his left hand on a skull. The portrait has the dates 1541 and 1597, the first date being the date of birth and the other one the date of the portrait. However, this issue does not contain the six-page illustrated supplement on fungi, "Paralipomena." Another issue lacks the portrait but does contain the supplement. A third issue contains the portrait and the supplement, but to date the compiler has only encountered this in one copy.

400. Reissue, 1600: De lapidibus, metallis et miro naturae artificio in ipsis terrae visceribus figuratis: necnon de stirpibus, insectis, avibus, aliisque animalibus, partim in fontis admirabilis Bollensis penetralibus, dum eius venas aquileas fodiendo perscrutabantur: partim in vicinia inuentis c. Medico. Montisbeligardi, Impensis Ludouici Koenig, apud Iacobum Foilletum, 1600.

4°: [8], 222, [2] blanks, [6], [2] blanks, [20] p., many woodcuts in the text.

RARE. This is the second printing of the very interesting description of stones, fossils, fruits, plants, insects, etc. found in the area of Bad Boll. The first edition was published as the fourth part of Bauhin's *Historia Novi et Admirabilis Fontis Balneique Bollensis* (1598). The unnumbered leaves between the blanks at the end contain some additional matter where among others mushrooms are figured. In the first edition were also included in this place three unnumbered leaves of poems, which are not present here; it is not clear whether they were included in this edition or not.

401. 2nd edition, 1607-8: De aquis medicatis noua methodus Ioan. Bauhini ... Libris quatuor comprehensa. Agitur in iis de fontibus celebribus, thermis, balneis uniuersa Europae, & potissimum ducatus Wirtembergici, eorum mixtionibus, metallis, succis inuestigandi, vtendi modo, ac eorum viribus. Item de varijs fossilibus stirpibus & insectis, quorum plurimae siue icones & regionum tabulae adduntur. Montisbeligardi, Apud Iacobum Foillet, 1607-8.

BAUMEISTER, Joseph Anton Ignaz Edler von. (BORN: Vienna, Austria, 20 November 1750; DIED: Vienna, Austria, 6 October 1819) *Austrian author & publisher.*

Baumeister was the son of a civil official and studied at the University of Vienna. In 1770, he published a dissertation concerning the history of the Steiermark state. In 1792, he was entrusted by Kaiser Franz II with the education of his sons, the Princes Ludwig and Rudolf. In recognition of this service, he was awarded with a position of advisor to the government. In his retirement, Baumeister worked on a chronology of world history.

Die | Welt in Bildern | vorzüglich | zum Vergnügen und Unterricht der Jugend. | [rule] | Herausgegeben | von | Joseph Edlem von Baumeister. | [rule] | Vierter Band. | [vignette] | (Mit 24 Kupfertafeln.) | [rule] | Wien | gedruckt und verlegt in der k.k. priv. von Baumeisterischen Buchdruckeren. | 1791.

2°: π² A-L² N² M¹ 2N¹ O-X¹ Y²; 40ℓ.; [4], 1-74, [2] p., 24 plates, title vignette. PAGE SIZE: 264 x 190 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [2 pgs], "An den Leser."—dated 18 August 1790.; 1-74, Text.; [2 pgs], "Inhalt."

PLATES: The illustrations are incorporated into the pagination of this work, and consist of engravings of usually 4 to 6 items of mineralogical interest. Each is numbered with an "N." followed by the plate number. Plates 2-3, 5-7, 9, 11-12 and 15-22 are signed in a fashion similar to "J. Sollander px. Mansfeld sc," while all other plates are unsigned. Plate descriptions are handled within the text of the work.

The plates show: N. 1 (page 1). 4 figures showing 2 medallions and 2 marble samples. N. 2 (page 5). 4 figures showing 2 marble slabs and 2 calcite crystal groups. N. 3 (page 9). 4 figures showing 1 selenite crystal group, 2

DIE WELT IN BILDERN, 1791

dendritic growths and 1 fluorite crystal group. N. 4 (page 13). 4 figures showing 1 quartz crystal group, 1 flint, 1 chalcedony and 1 cinnabar. N. 5 (page 17). 4 figures of agates. N. 6 (page 21). 7 figures showing ruby, sapphire, topaz, tourmaline, emerald and chrysolite. N. 7 (page 25). 4 figures showing amethyst, garnet and beryl. N. 8 (page 29). 5 figures of jasper (cabs). N. 9 (page 33). 4 figures of flint. N. 10 (page 37). 5 figures of feldspar (cabs). N. 11 (page 41). 6 figures showing various salt groups. N. 12 (page 45). 6 figures showing amber, coal and sulfur. N. 13 (page 49). 4 figures of gold and metallic ores. N. 14 (page 53). 4 figures of silver specimens. N. 15 (page 55). 4 figures of copper minerals, malachite and chalcocite. N. 16 (page 57). 4 figures of iron specimens. N. 17 (page 59). 4 figures of iron and magnetite specimens. N. 18 (page 61). 5 figures of lead, galena, mimetite and cerussite. N. 19 (page 63). 5 figures of bismuth, sphalerite and ores of zinc. N. 20 (page 65). 4 figures of antimony and cobalt minerals. N. 21 (page 67). 4 figures of nickel and arsenic minerals. N. 22 (page 69). 5 figures showing pyrolusite, scheelite and cerussite. N. 23 (page 71). 4 figures showing mercury and cinnabar specimens. N. 24 (page 74). 1 figure showing platinum nuggets in a pan.

VERY SCARCE. The volume described was published as the fourth number of *Die Welt in Bildern* (6 vols., Vienna, 1788-92), which was directed towards juveniles. The set's focus was to show the young reader a comprehensive view of the world through realistic pictures. This part treats things dug from the earth by marvelously illustrating a wide variety of minerals, agates and marble samples. Johann Sollander [see note below] prepared the master plates from actual specimens, and his effort shows in this truly beautiful illustrated mineralogy.

The work exists in two states. One with the title vignette and plates untinted, and the other with these illustrations deliciously hand-colored. The colored copies are printed on a better quality paper that makes the volume noticeably thicker, and at the time of their production undoubtedly more expensive. One could suspect that authentic colored volumes are rarer than their uncolored counterparts.

Johann Sollander. *Austrian painter.* No direct information found; however, this may refer to Johann Sollerer (Sollener) [1747-1809], Viennese painter of miniatures.

Mansfeld. *Austrian engraver.* Refers to a family of Viennese copper engravers. Active during the period were Johann Georg [1764-1817], Johann [1770-1825] and Johann Ernst [1739-1796].

VERY SCARCE, especially the second volume. In this attempt at a new form of systematic mineralogy, Baumer has arranged his system along a unique system. His arrangement includes burnable bodies, water, salts, earths, stones and ore and metals. He includes descriptions of accidental or jovial forms of stones and petrifications, metals and ores, and mountains of large masses. Although Baumer has compiled many oddities in his choices, citations are diligently recorded to other literature for each mineral species listed. The mineral descriptions are particularly good for the minerals found in the vicinity of Thüring, Germany. The second volume includes additions, corrections and reinterpretations to the first, arranged in the same way.

VERY SCARCE. Baumer discusses the uses of gemstones and other mineral substances in medicine, while making it clear that many of the precious variety can not be useful because they will not dissolve in the stomach. However, as a physician he knew that some 'earths' neutralize acid, or are soluble in water, and therefore of potential therepeutic use. He deplores the myths and superstions assigned to many of the stones, especially for there curative powers.

The text is divided into two parts. The first is a classification of gemstones, into precious, semi-precious, spurious, etc., with discussions of physical properties, origins, and differences between species. The second section describes other mineral substances, such as ochre and the earths that were used in medices of he late eighteenth century. Baumer makes note of curious lore and ancient beliefs attached to the same, together with details on the preparation and administration, and ills cured.

BAUMHAUER

BAUMHAUER, Heinrich Adolf. (BORN: Bonn, Germany, 26 October 1848; DIED: Freiburg, Germany, 1 August 1926) *German crystallographer, mineralogist & chemist*.

From 1866 to '70, Baumhauer was educated at the University of Bonn. Later he attended the University of Göttingen. Appointed professor of mineralogy at the University of Freiburg in 1895, he was also for a short period professor of inorganic chemistry. Baumhauer was elected a member Mineralogical Society of St. Petersburg, Russia. On his suggestion, an index to all chemical publications, the *Chemisches Zentralblatt* edited by German Chemical Society, was founded. He wrote numerous papers on mineralogy and the symmetry of crystals.

SCARCE. "The Realm of Crystals for every Friend of Nature, especially Mineral Collectors" is a popular style treatise that discusses the unusual beauty of natural mineral crystals. There are chapters on the nature of crystals, their forms, properties, etch figures, twinning, etc., followed by sections discussing the various crystal classes. The crystal classes are explained through the usual crystal drawings as well as fine drawings made from actual specimens. An appendix describes the use of Miller's symbols to label various crystal faces.

VERY SCARCE. In the *New Developments in Crystallography* the latest discoveries and methods invented in the science are presented. It was designed to bring workers up to date on the latest trends regarding terminology and symbols, but was not intended to develop a complete training in crystallography. Written less than a decade before X-ray analysis was invented, Baumhauer had a rich selection of practical and theoretical material to draw upon for his text. New facts and theories are discussed regarding symmetry and conditions of crystal formation, methods of instruction, relations between chemistry and crystal form, and twin crystals. An appendix explains the symbol designations applied to crystalline forms by Paul von Groth in his *Physikalische Krystallographie*.

Contents: I. Einleitung (pp. 1-22). II. Kristallklassen und Pseudosymmetrie (pp. 23-72). III. Ermittlung der Symmetrieverhältnisse der Kristalle (pp. 73-108). IV. Zwillingsbildung der Kristalle (pp. 109-128). V. Flächenentwicklung und Wachstum der Kristalle (pp. 129-156). VI. Chemische Kristallographie (pp. 157-180). Anhang (pp. 181-184).

RARE. An early discussion of the preparation and use of paint pigments. Such pigments are commonly made from animal, botanical and mineral products. However, pigments of blue color were the most difficult and expensive to make with the very best blue paint usually being made by pulverizing the precious stone lapis lazuli that was found in Afghanistan. This book discusses the color blue, its preparation and the best ingredients to create a pigment. The mineral olivine is also discussed for use in the preparations to present a greener hue to the paint.

BECCARI, Jacopo Bartolomeo. (BORN: Bologna, Italy, 25 July 1682; DIED: Bologna, Italy, 1766) *Italian physician.*

Beccari was professor of physics at the Institute Sciences and Arts in Bologna. He was elected president in 1723. In 1709 he was appointed professor of logic at the University of Bologna, later becoming professor of medicine in 1712. Beccari was named the first professor of chemistry at any Italian university (Bologna) in 1737. Elected a Fellow of the Royal Society of London in 1728. His best remembered studies describe phosphorescence, sexual functions, and the effect of light on silver salts.

Osservazioni Intorno alla Doppia Refrazione del Cristallo di Rocca, di Io. Bapt. Beccaria. Turino, 1764.

4°: A-B⁴; 8ℓ.; no pagination.

EXTREMELY RARE. Technical discussion of the phenomena of double refraction in quartz crystals. Newton had earlier shown that quartz or rock crystal like Iceland spar would refract light rays that passed

through it, although this phenomena is much less pronounced in quartz. In this work Beccari shows that the three different axis of a crystal refract light in different ways. No copy of this title has been traced, however, an earlier paper by Beccari appeared: "On the double refraction of crystals" (*Philosophical Transactions of the Royal Society of London*, **52** (1761), p. 486-490.).

VERY RARE. Collection/sale catalog of Becceler's natural history collection prepared by Rudolf Capell, and after his unexpected death, completed and edited by Johann Vegetius. Becceler's cabinet besides various animals and birds also contained minerals. In 1750, the catalog of the coin collection was published with the intention of selling it.

Rudolf Capell. (BORN: 1635; DIED: 1684) *German theologian, historian & philologist.* Capell studied at Wittenberg and Giessen. He became a professor at the University of Hamburg.

Johann Veget. (BORN: Geverstorf an der Oste, Germany, 10 June 1633; DIED: Hamburg, Germany, 12

June 1691) *German theologian & philologist.* Vegetius began studying theology at the University of Jena in 1654. In 1662, he was named Rector in Verden. Then in 1676 he accepted the position of professor of logic and metaphysics at the Gymnasium in Hamburg. His residence soon became the meeting place for the intellectuals of the city.

BECHER

BECHER

BECHER (Beccher), Johann Joachim. (BORN: Speyer, Germany, 6 May 1635; DIED: London, England?, October 1682?) *German physician & alchemist.*

Becher was mostly self-educated, although he was awarded the degree of M.D. from the University of Mainz in 1661. In 1663, he was appointed professor of medicine at Mainz and physician to the elector of Mainz. From 1664 to 1666, he stayed in Munich where that cities regent had furnished him with a laboratory. But in 1666, he was obliged to leave Munich. He went to Vienna, but in 1666 Leopold appointed him Imperial Commercial Advisor. In 1669 he arranged with the Dutch West Indies Company for a colony, in the South America. Becher was appointed public professor of medicine at the University of Mainz. He was appointed chamberlain to Count Zinzendorf in Vienna. While there he established a Werkhaus containing a chemical lab for manufacturing pigments as well as for working with wool, silk, and glass. In 1678, Becher went to Holland, where he sold the city of Haarlem a plan for a machine that would spool silk cocoons. In 1679 an invitation of Prince Rupert caused him to go to England where he inspected mines in Cornwall (and Scotland?).

RARE.

In his *Physicæ subterraneæ* (1667) Becher concluded that bodies were composed of three earths-terra lapidea (vitreous), terra mercurialis (mercurial),

PHYSICA SUBTERRANÆ, 1669

and terra pinguis (fatty). He considered combustible substances to be rich in terra pinguis, which was lost during burning. Even metals that were calcinable contained some of the fatty earth. Stahl later developed these ideas into an elaborate chemical system in which the term "phlogiston" replaced terra pinguis.

The potential comprehensiveness of the phlogiston theory proved amazingly good in a world in which chemistry still held a qualitative attitude toward matter. Not only did the theory explain combustion and calcination as being caused by the loss of phlogiston, it explained the smelting of ores equally well. Since the ore (calx) of a metal is converted into metal by heating with charcoal, a substance rich in phlogiston, Stahl argued that phlogiston was transferred from the charcoal to the calx, converting the later into a metal.

SCARCE. This is the last edition of Becher's famous work, and the only one published in quarto. "Stahl's edition of Becher's most important work (first published in 1669) the foundation of the phlogosiston theory. Its influence on Stahl was immense, and resulted in the present edition. To Becher's text, Stahl adds a 161 page commentary on Becher's theories, "Specimen Beccherianum," along with his own interpretations, modifications and innovations." This edition contains the three supplements as well.

First published 1669 with title: *Actorum Laboratorii Chymici Monacensis*; published in 1703 with title: *Physica Subterranea*. Includes three supplements of earlier editions. Includes indexes.

VERY RARE. A translation of *Auctorvm laboratorii chymici monacensis, seu Physicæ Subterraneæ libri duo* (2nd ed., Francofuti, 1681) with the inclusion of translations of the first two supplements and some additional material on alchemy. The translator was Becher. The long dedication to the Emperor Leopold I, dated 20 March 1675, gives a history of alchemy. The work was probably written in support of his unsuccessful attempt to extract gold from the sand of the Danube. This is probably the rarest of Bechers writings, unknown to many bibliographers.

RARE. Translation by Friederich Roth-Scholtz [see note below] of *Alphabetum Minerale* (1st ed.,

Frankfurt, 1682). The work was intended to supplement and clarify the first supplement of Becher's *Physica Subterranea* (Frankfurt, 1671). Written while the author was learning mining techniques in Cornwall, this is a dictionary of mining and mineralogical terms. The work is dedicated to ROBERT BOYLE.

Friederich Roth-Scholtz. (BORN: Herrnsstadt, Bavaria, Germany, 17 September 1687; DIED: Nuremberg, Germany, 15 January 1736) *German bookseller.* Bookseller and librarian, Rothsoltz compiled a large personal library of books, especially in chemistry, alchemy, and some mineralogy.

Majestât Gnad und Privilegio. | Ulm/ | In Verlegung Johann Gõrlins/ Buchhändlers allda.

4 parts in one volume. [Part 1] 2°: A-I⁶ K⁴; ??ℓ.; [12], [1]-104 p. [Part 2] 2°: A-Fff⁶ Ggg⁴; ??ℓ.; [1]-632 p. [Part 3] 2°: a-g⁶ h²; ??ℓ.; [1]-88 p. [Part 4] 2°: A-N⁶ O⁴)-()⁽⁶⁾)-()⁽²⁾; ??ℓ.; [1]-164, [28] p. About 1200 illustrations are included in the text. Originally issued in 4 parts, each with its own title page, all of which bear the date 1662.

CONTENTS: [Part 1] [2 pgs], Engraved Title page, dated 1663, verso blank.; [2 pgs], Title page, verso

blank.; [2 pgs], Dedication to Johann Shilipsen.; [4 pgs], "Vorrede."; [2 pgs], "Auslegung deß Kupfer-Tituls ..."; [1], Sectional title page, "Zoologia."; [2], Blank.; [3], "Eingang zu dem Ersten Theil."; [4], "Vorrede."; [5]-94, Text.; 95-104, "Beschluß über die | Zoologie."

[Part 2] [1], Sectional title page, "Phythologia."; [2], Blank.; 3, "Eingang zu dem andern Theil..."; 4, "Vorrede | ... | Kräuter=Buch."; 5-629, Text.; 630-632, "Beschluß über die | Phythology."

[Part 3] [1], Sectional title page, "Mineralogia."; [2], Blank.; 3, "Eingang zu dem Dritten Theil..."; 4, "Vorrede | ... | Berg=Buch."; 5-88, Text.

[Part 4] [1], Sectional title page, "Schola."; [2], Blank.; [3], "Eingang zu dem Vierdten Theil."; [4], "Vorrede über deß erläuterten."; 5-152, Text.; 163-164, "Beschluß über den Vierdten Theil."; [28 pgs], Recommendations and indexes to all four parts.

RARE. This is a description of the three realms of nature and their use in medicine. The first part describes the animal kingdom, beginning with man, followed by the beasts, birds, insects, lizards, etc. The second part is a botanical herbal that utilizes reworked illustrations from the earlier herbal of Mattioli. The third section is concerned with objects yielded by the earth including mineral resources, mines, minerals, fossils, stones, etc. Within the mineralogy section are descriptions of individual mineral types including petroleum, mercury, native metals, crystals, sulfur, coal, saltpeter, pyrite, arsenic, antimony, etc. The fourth section concerns the purposes to which nature can be put for the medical good of mankind and includes a section on distillation processes. A comprehensive index to all the parts is found at the book's conclusion. The text is heavily illustrated throughout but most particularly in the sections on animals and plants.

BECK

BECK, Lewis Caleb. (BORN: Schenectady, New York, U.S.A., 4 October 1798; DIED: Albany, New York, U.S.A., 20 April 1853) *American physician, naturalist & chemist.*

Brother of the physicians John B. Beck [1794-1851] and Theodric R. Beck [1791-1855], Lewis Beck graduated from Rutgers College in 1817. In 1830, he was appointed a professor of chemistry at Rutgers. In 1836, Beck became the mineralogist for the geological survey of New York. In 1840, he was named professor of chemistry at Albany Medical College. He authored many works on botany, chemistry and food adulteration.

SCARCE. One of the earliest systematic description of minerals of New York (the first being Webster, *Catalogue of the Minerals*, 1824), published as the third volume of a general natural history of the state. It is rich in locality information, with an extensive bibliography, an extensive examination of economic mineral deposits (iron, sulfide, copper ores, etc.) and a very detailed descriptive mineralogy (pp. 171-525), of which pages 459-525 are plates of crystal drawings.

Facsimile reprint, 1987: Special Publication #2 of the Rochester Mineralogical Symposium, 1987. No new material was added to this reprint.

BECKE

BECKE, Friedrich Johann Karl. (BORN: Prague, Czechoslovakia, 31 December 1855; DIED: Vienna, Austria, 18 June 1931) *Czech/Austrian mineralogist.*

Becke studied mineralogy at Vienna under Tschermak and Schrauf, graduating in 1880. In 1882, he became professor of mineralogy at the University of Czernowitz [now Cernăuți, Romania], and in 1890, at the German University at Prague. In 1898, he succeeded A. Schrauf at the University of Vienna, and later, G. Tschermak, retiring in 1927. Becke was an expert and pioneer in optical mineralogy, and from 1899, he acted as editor of *Tschermak's Mineralogische und Petrographische Mitteilungen*. He won the Wollaston Medal of the Geological Society of London in 1929.

BECKENKAMP, Jakob. (BORN: Horcheim near Coblenz, Germany, 20 February 1855; DIED: Würzburg, Germany, 12 January 1931) *German mineralogist.*

In 1872, Beckenkamp helped as a surveyor in remapping the Wiesbaden district of Germany. From 1876-9, he entered the University of Bonn, where he studied mathematics, physics and chemistry. Afterwards, he attended the University of Strasbourg, where he studied crystallography under P. GROTH, graduating 1881. Beckenkamp worked for a time on a geological survey of Elsass-Lothringen, but in 1897, he became professor of mineralogy and geology at the University of Würzburg, from which he retired in 1929. His principle research was on physical crystallography dealing with thermal, elastic, magnetic and electrical properties of crystals.

SCARCE. A comprehensive treatise, providing extensive discussion of the most current knowledge of crystallography. The first part covers the 'static' properties of crystals and theoretical discussions of the internal geometric structure. Included in this portion are discussions of previous theories including Haüy, Weiss, Hessel, notational systems, twins, pseudomorphs, thermal, elastic, magnetic and electrical properties of crystals, etc. The second part details 'kinetics' of crystals, or their behavior when interacting with light or other forms of radiation. Discussion includes crystal optics, with historical perspectives, goniometers, physical properties, theories of the arrangements of atoms within crystals, also touching on the recent discoveries of Von Laue and Bragg in X-ray crystal diffraction analysis. At the conclusion are comprehensive indexes to both parts.

SCARCE. This *Manual of Crystallography* is more or less an abridgement of the author's *Statische und Kinetische Kristalltheorien* (Berlin, 1913-5), omitting almost all of the historical perspective. Divided into six parts, this is a superb introduction to crystallographic science, however. In the first portion, Beckenkamp covers in detail the cubic, tetragonal, rhombohedral, monoclinic, triclinic and hexagonal systems, with descriptions of the crystal classes that occurs under each heading. The second part describes dielectric and magnetic phenomena that result from atomic arrangements within some crystals. The third section describes how piezo- and pyro-electrical properties occur by either rubbing or heating certain mineral crystals. A fourth section (pp. 141-278) describes optical properties of crystals, including reflection, interference patterns, double refraction, polarization, luminescence, etc. The fifth part (pp. 279-330) describes the influence of mechanical, thermal and chemical properties on the geometric and physical properties of crystals. The sixth and final section (pp. 331-443) covers structural theory and how it affects the geometric and physical properties of crystals. An errata to the author's previous *Statische und Kinetische Kristalltheorien* and a comprehensive subject index help conclude the work.

BECKER, August. (BORN: Osterburken, Baden, Germany, 19 February 1879; DIED: Heidelberg, Germany, 16 January 1953) *German physicist & crystallographer.*

In 1901, Becker received his Ph.D. from Heidelberg, where he had studied since 1897. From 1901 to 1907, he was an assistant at the Physical Institute in Kiel. But in 1907, he returned to Heidelberg, becoming professor extraordinary of theoretical physics. In 1935, Becker was appointed professor of physics and director of the Philipp Lenard Institute at the University of Heidelberg.

SCARCE. An important book in crystal optics outlining the theories of all components of the study, together with numerous practical examples taken from the mineral kingdom. The text covers crystals, light, refraction and dispersion, polarization, reflection, double refraction. The principles of Huygens concerning light within a transparent body and Fresnel's theories are reviewed.

Contents: Allgemeines (pp. 1-11). I. Geradlinige Polarisation (pp. 12-24). II. Wellenflächen (pp. 25-48). III. Chromatische Polarisation (pp. 49-125). IV. Zirkulare und elliptische Polarisation (pp. 126-151). V. Drehung der Polarisationssebene (pp. 152-192). VI. Lamellare Polarisation (pp. 193-205). VII. Absorption in Kristallen (pp. 193-205). VIII. Reflexion des Lichts (pp. 206-242). IX. Optische Kristallanalyse (pp. 243-253). X. Polarisationsapparate (pp. 254-312). XI. Theorien des Lichts (pp. 313-356).

CONTENTS: [i-ii], Half title page, "Geschiedenis Der Systematische Mineralogie," verso blank.; [iii-iv], Title page, verso blank.; [v], Dedication to J.L.C. Schroeder van der Kolk.; [vi], Blank.; vii-viii, Preface [not titled].; ix-xi, "Inleiding."; [xii], Blank.; xiii-xv, "Litteraturopgave."; [1 pg], Blank.; [1]-203, Text.; 204-205, "Besluit."; 206-209, "Lijst Der Namen."; [210], Blank.; 211-212, "Stellingen."

RARE. A treatment of the development of systematic mineralogy. Beekman abstracts several hundred different mineralogical classification schemes from Theophrastus to the end of the 19th century, together with brief notes on the primary source books. A valuable compilation for those interested in the rise of systematic mineralogy.

CONTENTS: [2 pgs], Title page, verso blank.; [4 pgs], "Vorrede."; 1-200, Text.; [16 pgs], "Register."

VERY SCARCE. A personal narrative of an excursion through northern Germany. The book is interesting for its account of the geology and fossil of the region, and also the author took a special interest in the mineral wealth of the region. Therefore, this work is principally a description of the various mines, quarries, and caves he chanced to visit. Of great value for reporting the state of the mining and metallurgy of the time. The text was reissued in an unaltered state in 1712 and again in 1720.

BÉNÉDICT DE SAUSSURE, Horace.

See: **Saussure, Horace Bénédict De.**

BENKŐ, Ferencz. (BORN: 1745; DIED: 1816) *Hungarian naturalist, mineralogist & theologian.*

Benkő was a Calvinist minister, who was elected priest of the Nagyszeben congregation in 1784. He began studies at Bethlen College, continuing at the Universities of Göttingen and Jena. While at Jena, Benkő attended the mineralogical lectures of J.F. Gmelin, which stressed the doctrines of Werner. Afterwards, he traveled in 1783 to 1784 throughout Transylvania, exploring all aspects of natural history. He was appointed in 1790 professor of natural history, geography and the German language at Nagyenyed College in Hungary. He held this appointment until his death. Benkő was the first professor to write and lecture in the Hungarian language. He was a champion of the natural history museum at Nagyenyed, to which Benkő bequeathed his own collection which included 2120 mineral specimens.

VERY RARE. An important treatise in the history of Hungarian mineralogy, being the first written in the native tongue and describing the mineralogy of this rich geological land. Benkő, once a student of Werner's at Freiberg, followed his former teacher's principles in his descriptions of the minerals. References to other literature are provided throughout.

Facsimile reprint, 1980s: This work on mineralogy, the first published in Hungarian, was reprinted sometime in the 1980s together with 65 pages of historical introduction and a modern index.

BENNETT, Lee Fent. (BORN: 22 August 1872; DIED: Kenosha, Wisconsin, U.S.A., 25 January 1966) *American geologist & mineralogist.*

Bennett was an alumnus (1895) as well as a faculty member (1898-1919) of Valparaiso University, where he taught the subjects of geology, zoology and mathematics. In 1919, he became the superintendent of the H.W. Gossard Co. factory in Janesville, Wisconsin. He lived in Janesville until 1928 when he moved to Saginaw, Michigan. He remained there until 1957, when because of poor health he moved to Kenosha, Wisconsin to live with a daughter. An entry in the 1914 yearbook for Valparaiso University says of Bennett: "When Professor Bennett tells a story or joke everybody laughs; not only because they are always good stories well told but because he finds a new story before he tells one. He has the happy faculty of making his work interesting. Nobody ever sleeps in his class ... He is a real friend of the students and besides being a good instructor he is a good all round fellow."

CONTENTS: [2 pgs], Title page, verso blank.; [2 pgs], "Altezza Reale."; [i]-vii, "Al Lettore Giuseppe Benvenuti [Prefazione]."; [viii], Blank.; "[ix]-xxiii, "Introduzione."; [1 pg], Blank.; [1]-81, Classification scheme.; [82], Blank.; 83-87, "Indice."; [88], Blank.; 89-90, "Indice degli Autori e di Dotti Uomini che Favorirono delle Notizie o dei Fossili."; 91-104, "Indice delle Materie."

VERY SCARCE. This beautifully printed volume contains a standard classification scheme. Its primary divisions are earths, stones, salts, inflammables, semi-metals, metals, petrifications and fluid minerals. Gatterer (1798-9) notes that this is "nothing other than a naked translation" of F.A. Cartheuser's *Elementa Mineralogiæ Systematicæ* (Francofurti ad Viadrum, 1755).

RARE. This useful book is a comprehensive bibliography of mineralogy, geology, palaeontology, mining and assaying in Russia until the end of the 18th century. In the forward, Berg provides a good review

REPERTORIUM DER LITERATUR, 1862

of previous bibliographical works in these fields. He then goes on to explain that his work covers literature not covered in any other bibliography. This includes both books and periodical literature in any language pertinent to these fields of study in Russia. Complete information including pagination is provided for each entry. The text is divided into various categories including Bibliography and History, Nomenclature and Dictionaries, Descriptions of Museums and Mineral Collections, Economic and Technical Mineralogy, Commercial Products of Mineralogy, Topographical Mineralogy, Physical Properties of Minerals, Geology, Palaeontology, Mining, Assaying and Salt Processing. Comprehensive name and subject indexes conclude the book.

BERGEMANN, Gustav Wilhelm. *German pharmacist & mineral collector.*

Bergemann was a very successful pharmacist in Berlin. As a hobby he built a superior mineral collection that represented different localities of each mineral species.

This cabinet was known as one of the finest of its time. It was acquired by Berlin's Humbolt University in 1837 after Bergemann's death.

BERGMAN

BERGMAN, Torbern Olof. (BORN: Katrineberg, Vestergötland, Sweden, 20 March 1735; DIED: Medevi, Sweden, 8 July 1784) *Swedish chemist, mineralogist, astronomer, physicist & geographer.*

Bergman entered the University of Upsala at the age of seventeen, from which his family expected he would graduate in either divinity or law, although he preferred mathematics and natural science. However, through overwork he injured his health and during his convalescence he studied botany and entomology to such good purpose he was able to send LINNEAUS several new kinds of insect. He returned to the University in 1758, and upon graduation began teaching there mathematics and then physics. Upon the resignation of J.G. WALLERIUS from the chair of chemistry and mineralogy, Bergman became a candidate for the appointment. Although opposed by many, he had a friend in Crown Prince Gustavus III, and chancellor of the University, who gained the appointment for Bergman. He held this post until the end of his relatively short life (he died at the age of 49). Bergman's most important chemical contribution was his *Essay on Elective Attractions* (English trans., London, 1775), a study of chemical affinity. His other writings covered many subjects but are all related to some aspect of science, most particularly chemistry and mineralogy. For example, in 1761 he was the first to discover the planet Venus had an atmosphere.

In chemistry, Bergman is considered the father of quantitative analysis, physical chemistry, modern chemical nomenclature, the concept of equivalent weights, and the electromotive series, and is the discoverer or made major contributions to the discovery of at least eight chemical elements: platinum, molybdenum, tungsten, manganese, cobalt, nickel, oxygen, and barium. In crystallography he has been considered a forerunner of Haüy in founding the science. He wrote the first great treatise in physical geography, *Physisk Beskrifning* (1st ed., Upsala, 1766-74), and he contributed substantially to our modern philosophy of science.

VERY SCARCE. This is the first edition of the collected scientific papers of Bergman, including memoirs on carbon dioxide, elective affinity, the blowpipe, and chemical analysis of minerals and mineral waters. Also contained in the collection are revised and expanded editions of many of the dissertations on chemical subjects offered by Doctoral candidates at the University of Uppsala. Bergman edited the first three volumes, contributing a prefatory essay "On the investigation of truth." The last three volumes were edited by E.B.G. Hebenstreit and were published after Bergman's death.

Contents of the six volumes: [Vol 1] Introitus de indagando vero.; De acido aëreo.; De analysi aquarum.; De aquis Upsaliensibus.; De fonte acidulari Danemarkensi.; De aqua pelagica.; De aquis medicatis frigidis, arte parandis.; De aquis medicatis calidis, arte parandis.; De acido sacchari.; De confectione aluminis.; De tartaro antimoniat.; De magnesia.

[Vol 2] De formis crystallorum, præsertim e spatho ortis.; De terra silicea.; De lapide hydrophano.; De terra gemmarum.; De terra turmalini.; De calce auri fulminante.; De platina.; De mineris ferri albis.; De niccolo.; De arsenico.; De mineris zinci.; De præcipitatis metallicis.; De minerarum docimasia humida.; De tubo ferruminatorio, ejusdemque usu in explorandis corporibus, præsertim mineralibus.

[Vol 3] De analysis ferri.; De causa fragilitatis ferri frigidis.; De acidis metallicis.; De diversa phlogisti quantitate in metallis.; De stanno sulphurato.; De antimonialibus sulphuratis.; Producta ignis subterranei chemice considerata (De productis vulcaniis); De attractionibus electivis.; De ferro et stano igne commixtis.

[Vol 4] De primordiis chemiæ.; Historiæ chemiæ medium seu obscurum ævum a medio sæculo VII. ad medium sæc. XVII.; De analysi lithomargæ. De terra asbestina.; Meditationes de systemate fossilium naturalis.; De connubio hydrargyri cum acido salis.; De laterum coctione rite instituenda.; De aquis acidulatis Medviensibus.; De fontibus medicatis Lokanis.; De cobalto, niccolo, platina et magnesia, eorumque per præcipitationes investigata indole.; Observatines nonnullæ de calculis urinariis.

[Vol 5] Analysis chimica pigmenti indicis.; De terris geoponicis.; De magnesia nitri.; De montibus Vestrogothicis.; Classes larvarum.; De galla quadam singulari.; De natura tenthredinum et erucarum spuriarum.; De pityocampe sive eruca pini.; De apibus ed mellifici vicissitudinibus ex alveorum ponderatione aestimandis.; De coco aquatico sive hirudine octoculata.; De hirudinibus.; Autororae boreales, annis MDCCLIX, LX, LXI & LXII. observatæ.; De aurorae borealis altitudine.; De arcus coelistis explicationibus.; Historia doctrinae de crepusculis.; De fulguratione observationes.; Experimenta electrica, transitum commotionis per aquam illustrantia.; De electicitate crystalli Islandicae.; Experimenta electrica cum tabulis vitreis sibi mutuo affricatis instituta.; Experimenta electrica cum taeniis sericis instituta.; De vi electrica turmalini.

[Vol 6] De crepusculis.; De interpolatione astronomica.; De attractione universali.; Oratio de nuperrimis chemiæ incrementis.; Observationes mineralogicae.; De avertendo fulmine.; Index.

Latin 1786-92: *Torberni Bergman ... Opuscula Physica et Chemica. Editio Nova Emendatior ...* Upsaliae, 1786-92. 3 vols. [Vol 1: 1788] 8°: xxiv, 388 p., 2 plates. [Vol 2: 1792] 8°: [6], 509 p., 2 plates. [Vol 3: 1786] 8°: [8], 488 p., 3 plates. New edition of the first three volumes of the *Opuscula*.

Ernst Benjamin Gottlieb Hebenstreit. (BORN: Leipzig, Germany, 10 February 1758; DIED: Leipzig, Germany, 12 December 1803) *German apothecary & physician*. Trained as an apothecary, Hebenstreit eventually was appointed professor extraordinary first of general medicine (1785) than anatomy and surgery (1793) at the University of Leipzig.

RARE. Much revised by Bergman through corrections and additions, this is a translation into French by Guyton de Morveau (or according to Partington by Mme. Picardet and supervised by Guyton) of the first two volumes of the *Opuscula Physica et Chemica* (Holmiae, Upsaliae & Aboae, 1779-80). Guyton himself added an introduction to each volume and a great number of long and valuable notes. When Bergman died, Guyton discontinued the translation.

Louis Bernard Guyton-Morveau. (BORN: Dijon, Côte d'Or, France, 4 January 1737; DIED: Paris, France, 2 January 1816) *French chemist & aristocrat*. Guyton-Morveau was a lawyer by profession and served from 1755 to 1782 as a member of the Dijon Parliament. Science had always been his hobby, and after his retirement, he turned his attention to chemistry. He worked with Lavoisier to reform the nomenclature of chemistry. When the French Revolution occurred, Guyton-Morveau returned to politics on the side of the revolutionists and survived the period, although he did nothing to help Lavoisier. He served as master of the mint under Napoleon, and was made a baron in 1811.

475. — German, 1782-90.

Kleine physische und chymische Werke. Aus dem Lateinischen übersetzt von Heinrich Tabor. [Volumes 4-6:] Nach dem Tode des Verfassers herausgegeben von E.B.G. Hebenstreit. Frankfurt am Mayn, 1782-90.

6 vols. [VOL 1: 1782] 8°: [2], [1]-548 p., 2 plates. [VOL 2: 1782] 8°: [1]-590 p., 2 plates. [VOL 3: 1785] 8°: [1]-614 p., 3 plates. [VOL 4: 1788] 8°: [16], [1]-502 p. [VOL 5: 1789] 8°: [4], [1]-490, [33] p., 6 plates. [VOL 6: 1790] 8°: [4], [1]-290 p., 2 plates.

VERY SCARCE. Translation by Heinrich Tabor of

2 vols. [VOL 1: 1787] 8°: [1]-46, [1], [1]-127, [1]-130, [1]-32, [1]-20, [1]-30, [1]-76, [1]-63 p., 4 plates. [VOL 2: 1788] 8°: [1]-119, [1], [1]-50, [1], [1]-48, [1]-83, [1], [1]-46, [1], [1]-29, [1], [1]-62, [1], [1]-109, [1], [1]-63, [1] p., 2 plates. The odd pagination is due to each of the individual dissertations having its own pagination within the vols.

VERY SCARCE. A selection of essays translated from the Latin of *Opuscula Physica et Chemica*, most based on the French edition of 1780-1785, with notes by Guyton de Morveau. They are all separately paged and signed, with some having errata at end. Most have Tofani's signed dedication and notes signed by him. There are also translations and notes also credited to Giovanni Fabbroni, with Tofani listed as printer and editor. There are four folded tables, not included in paging; the first unnumbered, the others numbered I-III, and two folding etched plates of chemical apparatus: "Dell' acque d'Upsal. Della Fonte Danimarchense. Dell' acqua del mare. Dell' acque medicinali fredde. Dell' acque medicinali calde."

Napoli issue, 1787: Opuscoli | Chimici e Fisici | di Torberno Bergman | Tradotti in Italiano | Con Aggiunte e Note | [rule] | Tomo Primo. [-Secondo.] | [rule] | [ornament] | Napoli MDCCCLXXXVII. [-MDCCCLXXXVIII.] | [rule] | Presso Giuseppe Maria Porcelli Librajo, | e Stampatore della Reale Acc. Militare | Con licenza de' Superiori.

2 vols. [Vol 1: 1787] 8°: a-b⁸ c⁴ A-Aa⁸; 213ℓ.; [2], [I]-XL, 1-384 p., 4 folding plates. [Vol 2: 1788] 8°: p² a-f⁸ A-X⁸ Y⁴; 222ℓ.; [4], I-XCVI, 1-343, [1] p., one folding plate.

Rare. This Naples edition of Bergman's dissertations copies the Firenze translation of 1787-8; however, Cole thinks this edition was authorized and not pirated as suggested by Monström. The contents of Tomo 1 are identical with those of the Firenze-edition. In Tomo 2 there are missing three papers; however, added to this volume is an Elogio storico di M. Bergman, by F. Vicq d'Azyr, translated from *Histoire de la Societe Royale de Medecine*, 1782-3, Paris 1787, pp. 141-187.

SCIAGRAPHIA REGNI MINERALIS, 1782

Sciagraphia Regni Mineralis

479. — Latin, 1782.

Torberni Bergman, | [...7 lines of titles and memberships...] | Sciagraphia | Regni Mineralis, | Secundum Principia Proxima | Digesti. | [rule] | [...3 lines of quotation in Latin, signed Ovidius...] | [rule] | Lipsiae et Dessaviae | In Bibliopolio Eruditorum | MDCCCLXXXII.

8°: A-K⁸ L⁴; 84ℓ.; [1]-166, [2] p. PAGE SIZE: 157 x 95 mm.

CONTENTS: [1-2], Title page, verso blank.; [3]-[6], "B.L."; [7]-146, Text.; 147-154, "Appendix Prima."; 155-166, "Appendix Secunda."; [2] pgs], "Errata."

VERY SCARCE. Perhaps edited by JOHANN JACOB FERBER, this is the first edition of Bergman's important foundational work in mineral classification and nomenclature. In the *Sketch of the Mineral Kingdom, digested according to the constituent parts of the substances that compose it*, Bergman shows his support for classifying minerals according to their chemical composition and not on the then common method of external appearance. Bergman's handbook, which is rich in observa-

tions about the chemistry of minerals, went further in regard to the subject than had its predecessors because Bergman had developed a portable blow-pipe kit. With this tool, which he took with him out into the field and was thus able to analyze minerals on the spot for their chemical constituents he was able to create a practical method of classification. In contrast to the previous systems of BROMELL and CRONSTEDT chemical knowledge had developed to a state where it was possible for a chemical system of mineral classification of to be prepared and be of practical use. Bergman recognized four major groups of minerals: salts, earths, metals, and inflammable bodies, and then subclassified each of these groups, exercising care in trying to provide a more consistent nomenclature than the contemporary standards.

In his attempt to reform mineralogical nomenclature, Bergman set up a systematic approach to the mineral kingdom. It closely follows the naming conventions used by Linnaeus to successfully name plants and involving two Latin names. This meant the naming of the mineral by the Latin name of the prevalent alkali, earth or metal combined with the name of the acid. For example, copper chloride would be called *cuprum salitum*. Bergman's nomenclature as used in the *Sciagraphia* was an attempt at a general reform of mineralogical as well as chemical names, and it was successful in this respect being adopted by Louis Guyton de Morveau in the same year, and thus helped to standardise chemical nomenclature. Bergman recognized four classes of pure chemical foundation, called salts, earths, metals, and phlogistic materials. These were translated into Latin as sales, terræ, metalla, and phlogistica. Two other classes were added to hold impure substances, petræ were rocks and petrificata were for organic fossil substances. These classes were then subdivided into genera after the method of Linnaeus.

The regard for Bergman as a scientist was such that his student and biographer, P.J. Hjelm, records that before the first edition of the *Sciagraphia* was printed, no less than five different translations of it were announced in different places. Not all of these original announcements materialized, although the text was eventually distributed in five different languages including German, Italian, French, English and Portuguese [which see next entries]. All this activity seems to indicate a considerable interest in Bergman's system for mineralogy.

In the Preface to his *Sciagraphia* Bergman stated that he had been urged by J.J. Ferber to publish his manuscript outline of mineral classification. This apparently lead Moström to conclude that the work had been "edited by J.J. Ferber." However, Bergman's text contains no evidence that this was the actual case. The Preface reads:

"In answer to the request of my very good friend, Mr. Ferber, I sent him a small outline of mineralogy in which the minerals were arranged according to their constituent elements. After looking it over, he asked my permission to publish it. At first I thought it would

be better not to publish a work so imperfect, especially considering the number of analyses which remained to be made. Mr. Ferber replied that a perfect method was not yet to be expected in so extensive a field, but that having once laid a foundation I might occasionally make such additions and corrections, in new editions of the work, as future experiments might make necessary. Indeed I was fully aware that the system would be perfected more quickly if submitted to the inspection of other more discerning Chemists, than if its completion depended solely on me. The different remarks of others will correct errors, which by further work I might have corrected, but if science is advanced, it does not matter by whom. So Genera and Species are given, except in the Appendices which, since they did not properly belong in my outline, contain Genera only. The Genera are based on the principle elements, and the Species on the remaining components. Varieties depend upon external appearances, and are therefore omitted here."

Related work, 1773: "Variae crystallorum formae a spatho ortae," in: *Nova Acta Regiae Societatis Scientiarum Upsaliensis*. Upsaliae, 1773, 1, 150-155, one plate.

Bergman's pupil Johann Gottlieb Gahn had discovered that the scalenohedra of "dog tooth" spar (calcite) when cleaved along certain planes would allways yield a rhombohedral kernel the same shape as ordinary calcspar. On this and other observations, Bergman authored "Various crystal forms that take their origin from spar," which described a new theory of crystal structure that was of the utmost importance in the development of crystallographic science. He noted that since crystals present such a seemingly endless variety of forms, it appears as though Nature were joking with us. However, by careful study and comparison, he deduced that these multitude of forms could all be derived from simpler bodies which he called "primitive forms." He confined his study to calspar and its basic form the "oblique parallelepiped." Using this basic shape he theorized that they arranged themselves in thin sheets (lamellae) which when stacked together produced the widely divergent forms found in Nature. From the view point of history, Bergman's lamellar theory is one of the first attempts to explain how widely divergent crystal forms could be derived from simpler shapes, and one which René Just Haüy would accept and greatly expand upon in his own writings. This work appears in the *Opuscula* (see: 2, 1-56).

RARE. Translation by Joseph Xavier Lippert of *Sciagraphia Regni Mineralis* (Lipsiae, 1782). It is a standard, but competent translation, following the format of the original text, with some minor additions. It discusses the theoretical classification of minerals before providing a descriptive mineralogy divided into classes of salts, earths, stones and metals.

RARE. Translation by William Withering of *Sciagraphia Regni Mineralis* (Lipsiae, 1782), this first edition in English contains some additions by the translator.

William Withering. (BORN: Wellington, Shropshire, England, 28 March 1741; DIED: Larches near Birmingham, England, 6 October 1799) *English physician*. Withering graduated with his M.D. from the University of Edinburgh in 1766. In 1774, he then opened a medical practice in Birmingham. He was the first to describe native barium carbonate, later named after him as the mineral species, witherite. Withering is best known as a botanist, and his work on the foxglove is a classic. He was elected a Fellow of the Royal Society of London in 1784. He had collections of both minerals and plants.

VERY SCARCE. First French translation by J.-A. Mongez from *Sciagraphia Regni Mineralis* (Lipsiae, 1782), and dedicated to the Comte de Vergennes. It is an important mineralogical work with extensive notes added by the translator to each mineral described and numerous citations to the works of other chemists and mineralogists. It went far in promoting the general reform of chemical and mineralogical nomenclature first in France and then the rest of Europe.

Jean-André Mongez. (BORN: Lyon, France, 1751; DIED: Lyon, France, 1788) *French chemist, naturalist & writer*. Distinguished as a writer on the physical sciences, Mongez contributed articles to the *Journal de Physique* on botany, chemistry and physics. He was elected to the Academie des Sciences in 1785.

SCARCE. Second edition in French, retaining the translated text and extensive notes added by M. Mongez and with expanded comments by JEAN CLAUDE DE LA MÉTHÉRIE. This edition is one of the most important works in the chemical classification of minerals published in the late eighteenth century, showing the state of both chemistry and chemical mineralogy at the time.

8°: A-D⁸; 32ℓ.; [1]-64 p., one folding plate (showing a blowpipe, lamp and equipment).

CONTENTS: [1-2], Title page, verso blank.; [3-4], Text (=introduction.); [5]-64, Text.; [At end], one plate.

RARE. In *De Tubo Ferruminatorio* Bergman provides the fullest account to date of the equipment and fluxes used in blowpipe analysis. Using a modified three-piece blowpipe made from silver with a gold tip, he records the reactions of minerals fused with the three fluxes of soda, borax and microcosmic salt (sodium ammonium phosphate) in hollow charcoal supports or silver or gold spoons. He is also the first to distinguish between the oxidizing and reducing flames of the flame, which he used with excellent effect in qualitative analysis to determine the elements making up many minerals. Although introduced by Swab, Rinman, Cronstedt and popularized by Engström, it was Bergman's success in blowpipe analysis and his excellent texts that made it an important tool of the mineralogist and chemist for almost two centuries.

RARE. Swedish translation by Peter Jacob Hjelm of the revised Latin edition of *Commentatio de Tubo Ferruminatorio*, which appeared in the *Opuscula Physica*

BERGMAN

et Chemica (Upsaliae, vol. 2, 1780, pp. 455-506). It encompassed all that was known to that time on the use of the blowpipe.

Peter Jacob Hjelm. (BORN: Sunnerbo Hårad, Sweden, 2 October 1746; DIED: Stockholm, Sweden, 7 October 1813) *Swedish chemist*. In 1782, Hjelm was appointed an assayer at the mint. Then in 1794, he became the warden of the mint in Stockholm and overseer of the chemistry laboratory at the Bergcollegium. He was elected a member of the Swedish Academy of Science in 1787.

Meditationes de Systemate Fossilium

492. — Italian, 1784.

Torberni Bergman | [...6 lines of titles and memberships...] | Meditationes | De | Systemate Fossilium | Naturali. | Editio Prima Italica. | Praefatus Est Et Indicem Adjecit | Eeditor Italus. | [ornate rule] | Florentiae MDCCLXXXIV. | [rule] | Typis Josephi Tofani | Superiorum Permissa. | Prostant venales apud Aloysium Carlieri | in Via dei Guicciardini.

8°: A-H⁸; 64ℓ.; [1]-125, [1] p.

CONTENTS: [1-2], Title page, verso blank.; 3-10, "Editoris Praefatio." (=preface.); 11-124, Text.; 125, "Index." (=table of contents); [1 pg], Blank.

RARE. Translated and edited by Italus [pseudonym] from "Meditationes de systemate fossilium naturali" (see: *Nova Acta Regiae Societatis Scientiarum Upsaliensis*, 4 (1784), pp. 63-128). In his "Meditation on a System of Natural Fossils," Bergman joined his voice to those of Guyton de Morveau and Pierre Joseph Macquer in proposing of the chemical nomenclature was necessary. He proposes that absurd names that memorialize their discoverers be eliminated. Also, names that refer to some mysterious property should be dropped.

This is Bergman's last major statement in mineralogy, published the year of his death. It indicates that had he lived, he would have collaborated with De Morveau on a complete overhaul of chemical/mineralogical nomenclature.

The different bodies that make up the mineral kingdom are briefly defined and include organic, solid and liquid items. Reasons are then provided why they need to be organized into a classification system. This is followed by speculation on mineral formation and descriptions of physical and chemical properties, such as form, specific gravity, hardness, behavior in fire, before the blowpipe and methods of examining fossils by the wet method. At the conclusion is a long discussion providing reasons and the theory behind Bergman's system of nomenclature.

Latin, 1782: *Commentationes, e quarto novorum Reg. Scientiarum Societatis Upsaliensis actorum tomo excerptae*. Upsaliae, 1782. 4°: [2], 51-631 (i.e., 136) p. This

work contains three of Bergman's papers. These are, "Commentatio chemica de causa fragilitatis ferri frigidi," "Meditationes de systemate fossilium naturali" and "De ferro et stanno igne commixtis." These papers are reprints with a specially printed title page, published beforehand from volume 4 of *Nova acta Regiae Societatis Scientiarum Upsaliensis*, which did not appear until 1784.

Dissertations related to Mineralogy

494. Dissertation, 1774: Chemisk och Mineralogisk Afhandling | om | Hvitajärnmalmer, | [double rule] | Med den Vidtberömda Philosoph. Facult. i Upsala | Samtycke, | Under Inseende | Af | Mag. Torb. Bergman, | Chemiæ Professor och Ridd. af Kongl. Wasa-Orden; Ledamot af | Kejsarl. Acad. Naturæ Curiosorum, Kongl. Vet. Acad. | i Stockholm, och Kongl. Soc. i London och Upsala, | Til almätt ompröfvande, | F.M.D. 22 Junii 1774 i Gustavian-ska Lärosalen, | Utgifven | Af | Peter Jacob Hjelm, | Smolänning. | [rule] | Upsala, | Tryckt hos Johan Edman, Kongl. Acad. Boktryck.

4°: π² A-E⁴ F¹; 23ℓ.; [4], [1]-42 p. PAGE SIZE: 182 x 148 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [2 pgs], Dedication.; [1]-42, Text.

VERY SCARCE. This dissertation, in which Peter Jacob Hjelm was respondent describes white ores of iron (ferrous carbonate), providing analyses and show also that manganese is an important component in the composition of superior steels. The text provides a method for detecting manganese within minerals. The text was revised and translated into Latin (*Opuscula*, vol. 2, 1780, pp. 184-230).

Peter Jacob Hjelm. (BORN: Sunnerbo Hårad, Sweden, 2 October 1746; DIED: Stockholm, Sweden, 7 October 1813) *Swedish chemist*. In 1782, Hjelm was appointed an assayer at the mint. Then in 1794, he became the warden of the mint in Stockholm and overseer of the chemistry laboratory at the Bergcollegium. He was elected a member of the Swedish Academy of Science in 1787.

CONTENTS: [1-2], Title page, verso blank.; [3]-30, Text.; [4 pgs], "Nickel Malmer ..."

VERY SCARCE. In 1751, Cronstedt did chemical analyses of a mineral called Kupfer-nickel [niccolite], which had been thought to contain copper because when dissolved in acid the mineral produced a blue colored solution. Upon further investigation, involving attempts to precipitate copper metal from the solution, Cronstedt concluded that the mineral did not contain copper but a new type of metal, which in 1754 he named nickel, after the material from which it was first obtained. Although most of Cronstedt's contemporaries accepted his findings, there were many important chemists of the period who believed Cronstedt had not discovered a new metal but a complex alloy of copper, arsenic, iron and cobalt. It was not until Afzelius defended Torbern Bergman's dissertation *De Niccolo*, that Cronstedt's claim was universally accepted. A revised edition appears in the *Opuscula* (vol. 2, 1780, pp. 231-271).

Jan Afzelius. (BORN: Larss Församling, Skara Stift, Sweden, 13 June 1753; DIED: Upsala, Sweden, 20 May 1837) *Swedish chemist*. Afzelius was professor of chemistry, metallurgy and pharmacy at the University in Uppsala. He was a member of the Academy of Sciences, Stockholm.

4^o: π¹ A-C⁴; 13ℓ.; [2], [1]-24 p. PAGE SIZE: 178 x 146 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [1]-24, Text.

VERY SCARCE. This dissertation to which Anders Pihl was respondent gives a short history of arsenic, its chemical behavior in metal, calx and ore forms, and its action as a mineralizer. The view is expressed that metals are only acids bound together by different quantities of phlogiston. A revised edition appears in the *Opuscula* (vol. 2, 1780, pp. 272-308).

Andreas Pihl. (BORN: 26 February 1759; DIED: c1835) *Swedish mining expert*. Pihl matriculated at the University of Upsala in 1772, and took his mining degree in 1777. He worked at mines throughout Sweden, most especially at Falun.

MINERARUM DOCIMASIA HUMIDA, 1780

500. Dissertation, 1780: *Dissertatio Metallurgica* | De | *Minerarum* | *Docimasia Humida*, | *Quam*, | *Venia Amplissimæ Fac. Philos.*, | *Praeside* | *Mag. Torb. Bergman*, | *Chemiæ Prof. Reg. et Ord.*, *Regiique Wasæi Ord. Equite Aurato*, | *Publice Ventilandum Sistit* | *Petrus Castorin*, | *Vestmannus*. | *In Auditorio Gustaviano Majori*, | *Die 7 Jun. Anno 1780*. | [rule] | *Upsaliæ*, | *apud Joh. Edman, direct. et reg. acad. typogr.*

4°: π^1 A-E4; 21 ℓ .; [2], [1]-40 p. PAGE SIZE: 182 x 146 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [1]-40, Text.

VERY SCARCE. This important dissertation to which Petrus Castorin was respondent, is a greatly expanded and revised edition of Bergman's previous *Chemisk Afhandling om järnmalmus proberande* (Upsala, 1777). The text gives detailed and practical methods for qualitative and quantitative analysis of 15 different metals in ores, including silver, mercury, lead, iron, copper and zinc. The wet method of analysis is recommended because of its accuracy and reliability even though it takes considerably longer to perform than the dry method. A new edition appears in the *Opuscula* (vol. 2, 1780, pp. 399-454).

Per Castorin. (BORN: Grythytt, Sweden, 19 October 1761; DIED: Elfvestorp, Sweden, 20 January 1808) *Swedish mining expert*. Castorin became the third generation of his family to attend the Swedish Mining Academy. He matriculated at the University of Upsala in 1774, and graduated in 1780. He worked at the Swedish mining centers of Grythytt and Hällefors and Hjulsjö.

CONTENTS: [2 pgs], Title page, verso blank.; [1]-73, Text.; 74, "Errata typographica."

VERY SCARCE. This highly important dissertation to which Johann Gadolin was respondent examines the impurities in iron from different sources. The list of impurities found includes sulfur, plumbago (carbon), arsenic, zinc and manganese. Results are provided for analyses of various samples of iron and 273 experimental tests are cited. It establishes that a successively greater amount of iron is found in wrought iron, steel and cast iron, and thus helped define quality in steel. Revised and enlarged in the *Opuscula* (vol. 3, 1783, pp. 1-108).

French transl., 1783: *Dissertatio chemica de Analysi Ferri* ... Respondent Johannes Gadolin. [Translated by Grignon.] Paris, 1783.

Johan Gadolin. (BORN: Åbo near Helsingfors (Helsinki), Finland, 5 June 1760; DIED: Wirmo, Finland, 15 August 1852) *Finnish chemist*. Son of astronomer and physicist Jacob Gadolin [1719-1802]. For a time, Johann was a student of BERGMAN at the University of Upsala. From 1786 to 1788, Johann traveled outland to complete his studies and broaden his knowledge. He became a docent at the University of Åbo in 1789, and following GADD's death, he was appointed professor of chemistry; a post he held until 1822. He specialized in the analysis of rare earth elements, and is credited with the discovery in 1794 of the element yttrium. Gadolin's mineral collection was destroyed in 1827 by fire when the Turku Academy burned down. Gadolin held membership in the Academy of Science in Stockholm. The mineral "Gadolinite" was named in his honor by M.H. Klaproth in 1802.

506. — Spanish, 1794 [Spanish transl.].

Elementos físico-químicos de la análisis general de las aguas. Obra compuesta de las siete disertaciones primeras de los opúsculos físico-químicos del ilustre ... traducidos del latin al francés por M. de Morveau, y de este al castellano, con arreglo á la nueva nomenclatura, con varias adiciones y por un òrden más conforme á este tratado, por el Capitan de Caballería D. Ignacio Antonio de Soto y Araujo ... Madrid, Imp. Real siendo regente D. Lázaro Gayguer Impresor de Cámara de S.M., 1794.

4°: xii-lxx, 353 p., 3 plates, one table.

RARE. Translated by Ignacio Antonio de Soto y Araujo from volume I of the *Opuscula*). Based on the contents listed in Monström, all the papers deal with mineral waters, and not mineralogy.

BERGMÄNNISCHES JOURNAL.

507. — German, 1788-99 [Periodical].

Bergmännisches Journal. Freiberg, Craz, 1788-1793, 1795, 1799.

12 vols. Continued as: *Neues bergmännisches Journal*, 4 vols., 1795-1815. PAGE SIZE: 178 x 108 mm.

VERY SCARCE. Edited by Alexander Wilhelm Köhler [see note below] this important mineralogical and metallurgical journal was based at the center of the German mining community in Freiberg. It is complete in six volumes each in twelve issues. It was continued as: *Neues Bergmännisches Journal*, which had irregular publication through 1815. Being published in the home city of the Bergakademie, many articles came from the leading German mineralogists of the period, including early publications of A. von Humboldt, C.A.S. Hoffmann, D.L.G. Karsten, M.H. Klaproth, and A.G. Werner.

Alexander Wilhelm Köhler. (BORN: Freiberg, Germany, 5 July 1756; DIED: Freiberg, Germany, 23 December 1832) *German mining expert.* From 1786 to 1824, Köhler was an instructor in mining techniques at the Freiberg Bergakademie. He was then appointed to the post of assessor for the state mining commission.

REFERENCES: BL: [990.c.1-12.]. • *Freilich Sale Catalog*: no. 48. • Hoover Collection: no. 116 [5 vols. only]. • Roller & Goodman, *Catalogue*, 1976: 1, 102. (Köhler) Meusel, *Verstorbenen Teutschen Schriftsteller*, 1802-16. • Poggendorff: 1, col. 1291.

BERGMÄNNISCHES WÖRTERBUCH.

508. — German, 1778.

Bergmännisches Wörterbuch, darinnen die deutschen Benennungen und Redersarten erklärt und zugleich die in Schriftstellern befindlichen lateinischen und französischen angezeigt werden. Chemnitz, J.Ch. Stoßel, 1778.

8°: [6], [1]-630, [4] p.

VERY SCARCE. The compiler of this dictionary signs the foreword as 'Bergbedienter' (=servant of mining). It is a lexicon of mining terms in German, including much that is of mineralogical interest, with definitions and citations to contemporary works written in German, Latin and French.

REFERENCES: BL: [no copy listed]. • GV (1700-1910): 158, 324. • LKG: VIII 8.

BERKENHOUT, John. (BORN: Leeds, England, 8 July 1726; DIED: Besselsleigh near Oxford, England, 3 April 1791) *English physician.*

Berkenhout graduated with a medical degree from the University of Leyden in 1765. The son of a merchant who originally came from Holland. It was intended that he should follow a career as a merchant, but at the outbreak of war between England and France in 1756 he was commissioned an officer. In 1760 at the conclusion of the

BERKHEY

war, he entered Edinburgh University to study medicine, later transferring to Leyden. He served as a British agent in the colonies during the American Revolution. Was captured, but managed to escape back to England. Besides a medical practice, he devoted most of his energies to writing books on a variety of subjects.

ATLAS MINERÁLŮ

512. — Czech, 1907.

Atlas | Minerálů | Textem provází | Alexander Bernard, | Professor C.K. Gymnasia Y Táboře. | O 26 Tabulích S 396 Kolorovanými Obrazy Nerostů | A 73 Obrazy V Textu. | [ornament] | [rule] | [...2 lines of text...] | [rule] | V Praze. | Nakladatel I.L. Kober Knihkupectví. | 1907.

4°: [28], 80, [4] p., 26 chromolithographic plates (showing 396 minerals, gemstones, etc.), 73 text illus. PAGE SIZE: 300 x 240 mm.

RARE. This *Atlas of Mineralogy* is an elementary textbook that is especially interesting because of its inclusion of the 26 chromolithographic plates that were previously issued in Gustav Adolf Sauer's *Mineralkunde* (Stuttgart, 1905-6) and also used in F. Leteur's *Traité Élémentaire de Minéralogie Pratique* (Paris, 1907).

BERTELE, Georg Augustin. (BORN: Ingolstadt, Bavaria, Germany, 27 August 1767; DIED: Landshut, Austria, 19 July 1818) *German physician & naturalist.*

Bertele studied natural history and medicine in Ingolstadt, Würzburg and at the Bergakademie in Freiberg. In 1792 he became a physician and in the following year he became a professor at the University of Ingolstadt. There, Bertele taught chemistry, mineralogy, pharmacy, pharmacology, botany and zoology. He was a member of the Mineralogischen Sozietät in Jena.

HANDBUCH DER MINEROGRAPHIE, 1804

VERY SCARCE. In the forward, Bertele records that he was inspired to write this work as a result of studying the recent mineralogies of EMMERLING, ESTNER and REUSS. He felt that his effort was more complete and understandable. The first portion of the text is an introduction to mineralogical science. The second and largest part is a descriptive mineralogy, organized along the chemical classification suggested by D.L.G. KARSTEN's *Mineralogischen Tabellen* (Berlin, 1800). An alphabetical list of all the mineralogical species contained is included at the beginning of the work.

BERTEREAU

BERTEREAU, Martine de Baronne de Beausoleil. (BORN: c1601; DIED: 1640) *French woman mineralogist.*

Martine de Bertereau, an expert dowser, and her husband Jean de Chastelet, Baron de Beausoleil et d'Auffenbach, an expert in mineralogy and mining, made a name for themselves in 17th century Europe. Using a variety of hazel branches and metal rods, Martine reportedly located rich mineral and water deposits. But when the infamous French Cardinal Richelieu caught wind of exactly how Martine was prospecting, he pitched the couple into prison, along with two of their kids.

LA RESTITUTION DE PLUTON, 1640

521. — French, 1640.

La | Restitvtion | De Pluton. | A Monseigneur | L'Eminentissime | Cardinal Dvc | De Richelieu. | Des Mines & Minieres de France, cachées & | detenues jusques à present au ventre de la | terre, | pare le moyen desqueiles les Finances | de la Majesté seront beaucoup plus grandes | que celles de tous les Prince Chrestiens, & | ses sujets plus heureux de tous les Peuples. | Ensemble la raison pourquoy les dites Mines & Minieres | ont esté iusques à present presque inutiles & sans pro- | fit à la souueraineté & Maiesté Royale. | Par Martine de Bertereau, Dame | & Barone de Beausoleil & d'Auffembach. | [rule] | A Paris, | Chez Herve' dv

Mesnil, ruë S. Iacques, à la | Samaritaine. | [rule] | M. DC. XXXX. | Avec Privilege Dv Roi.

8°: a⁸ A-L⁸; 96ℓ.; [16], [1]-171, [5] p., 7 woodcuts, and an engraved coat of arms. Pages [103]-[109] contain astrological charts. Cardinal Richelieu's coat of arms on plate before text. Head pieces, initials. PAGE SIZE: 165 x 95 mm.

CONTENTS: [2 pgs/=a1], Title page, verso privilege.; [10 pgs/=a2r-a6v], Dedication to Cardinal Richelieu.; [2 pgs/=a7], "...Sonnet."—signed De Bertereau.; [1 pg/=a8r], Blank.; [1 pg/=a8v], Richelieu's Coat-of-Arms.; [1]-171 (=A1-L6r), Text.; [4 pgs/=L6v-L8r], "Privilege | du Roy."; [1 pg/=L8v], Blank.

VERY RARE. Work on mining and mineralogy authored by the only documented woman mineralogist of her time. She married Jean Du Chatelet, Baron Beausoleil, inspector of mines of the German empire and together they visited the mines of South America, Hungary and Germany. When Beausoleil secured the authorization to survey the whole of the French territory for the discovery of mines and minerals, his wife accompanied him in his travels throughout France. This book is the outcome of their work. Written in the form of an appeal to Cardinal Richelieu to open and operate the French mines, it contains a long list of these mines, discusses all minerals found, speaks of different sciences to be studied by a mining expert. Ultimately, the author was imprisoned by order of Richelieu, because of suspicion of witchcraft in the use of divining rods. She died in prison.

French, 1751: This work was reprinted in A.A. BARBA's *Metallurgie, ou, l'Art de tirer et de purifier les Métaux*, Paris, 1751, 2, 56-151 [which see entry under Barba].

BERTHOUT, Johann Paul Vanberchem.

See: Vanberchem-berthout, Johann Paul.

BERTRAND, Bernard Nicolas. (BORN: Paris, France, 1715; DIED: Paris, France?, 29 September 1780) *French physician.*

Bertrand was the son of the physician and long time professor of surgery and pharmacy at the University of Paris, Thomas Bernard Bertrand [1682-1751]. Bernard followed in his father's profession and became a medical doctor. He also was a counselor to the rulers of Poland.

SCARCE. Published with only initials on the title page to indicate the author, these stand for: Monsieur Bertrand, Conseiller Palatin de la Cour de Pologne. This small volume is a popular-style summary of mineralogical science designed to serve those who desired a ready made plan on which to arrange their cabinet of fossils and minerals. It includes a justification for the science of mineralogy, a brief summary of the science's theory, a survey of mineralogical literature and a systematic enumeration and description of minerals. The system outlined is based upon the standard classes.

[Vol 2] [2 pgs], Half title page, "Dictionnaire | Oryctologique | Universel. | [double rule] | Tome Second," verso blank.; [2 pgs], Title page, verso blank.; 1-256, Text.

SCARCE. An early comprehensive dictionary defining terms used in the 18th century study of oryctology, which by today's convention would include all of the earth sciences such as geology, mineralogy, crystallography, paleontology, and vulcanology. In the alphabetical list, various terms deal with earths, salts, sulfurs, bitumens, petroleum, simple and complex stones, common and precious gems, minerals, metals, petrifications of animals and plants, the latest theories on their formation, and their uses. In many instances a substantial definition is provided, which shows Bertrand's good knowledge of the subject. Volume one covers words beginning with the letters A to L, while volume 2 continues M to Z.

Another issue: La Haye, 1764.

près les RR. PP. Jésuites.
M. DCC. LXVI.

RECUEIL DE DIVERS TRAITÉS, 1766

VERY SCARCE. A reprint collection of six of Bertrand's earlier works including: Mémoire sur la structure intérieure de la terre – Essai sur les usages des montagnes – Mémoires historiques et physiques sur les tremblemens de terre – Essai d'une distribution methodique des fossiles – Essai de minérographie, et d'hydrographie du Canton de Berne – Lettre sur les inondations du Nil, et l'usage des montagnes de l'Abissinie – Lettre sur la diminution les mers, et l'origine de montagnes. An index at the end provides a listing of the titles of the works together with a breakdown of the important sections in each.

Perhaps the most important monograph contained in the collection is the "Essai de minérographie, et d'hydrographie du Canton de Berne." This is the first "Mineralography," which is a alphabetical listing of the Cantons throughout Switzerland, with details given of the minerals and therapeutic springs that may be found at each location. When this work was written, this was a quite new, and useful format for describing the mineral wealth of a geographical area.

Another issue: Identical issue, with the date of 1767 is also recorded.

Contents: I. Mémoires sur la structure intérieure de la Terre (in 3 parts, pp. 1-104). II. Essai sur les usages des montagnes (pp. 105-222). III. Mémoires historiques et physiques sur les tremblemens de terre (pp. 223-380). IV. Essai d'une distribution methodique des fossiles (pp. 381-434). V. Essai de minérographie, et d'hydrographie du canton de Berne (pp. 435-486). VI. Essai de minérographie du canton de Berne, systematiquement rangée (pp. 487-496). VII. Catalogue du Cabinet d'histoire naturelle de M.

E. Bertrand (pp. 497-508). VIII. Lettre sur les inondations du Nil, et l'usage des montagnes de l'Abissinie (pp. 509-526). IX. Lettre sur la diminution des mers, et l'origine des montagnes (pp. 527-541). Table des matières (pp. 542-552).

RARE. REWORK COMMENTARY: Containng the first issue of volume one, dated 1790. One of the great illustrated juvenile series of the nineteenth century, Bertuch's *Picture Book for Children* is a magnificently illustrated childrens encyclopaedia of everything that was the largest publishing venture ever undertaken by Bertuch. Issued by monthly subscription the completed work published between 1790 and 1830 consisted of 237 parts with a total of 1,185 hand-colored copper engravings. A complete set cost 120 Thaler or about twice the yearly salary of a common worker, yet by using the subscription method, the publiser was able to sell many sections. The *Bilderbuch* contains a pleasant collection of well illustrated natural history and science articles about animals, plants, flowers, fruits, minerals, insects. It is a substantial work, very popular in its time, as a tool for instruction through words and pictures. The publication history is complex because it was one of the largest publication projects of that time. The most complete sets of the *Bilderbuch* are composed of 12 volumes with accompanying text in German and French. The 12 volumes are structured in 14 Themes: quadruped animals, birds, fish, insects, plants, humans, worms, shells, corals, amphibian, minerals, buildings, antiquities and mixed objects. In 1796 Bertuch began publishing the accompanying texts, helped by Karl Friedrich Funke [1752-1807]. The whole project becoming the first encyclopedia about nature and earth. Today, this work is sought after for the many quaint hand-colored illustrations it contains.

This remarkable children's work, which was being reissued even as the first edition was still bein published has a very difficult bibliography. This seven volume set usually contains a third revision of the first volume published in 1792, which prints Bertuch's name on the title page for the first time. The text has been reprinted with the French appearing with the German from page one, and all previous errata having been corrected. This is normally(?) the series that constitutes the first edition of Bertuch's *Bilderbuch*. Volumes 1-3 have German and French on alternate pages, volumes 4 through 7 are written in German, French, English, and Italian. Volumes 6 and 7 were prepared by Carl Bertuch, son of the author. Titles vary slightly from volume to volume.

Rathe, und mehrerer gelehrten Gesellschaften Mitglie. Erste Lieferung. Taf. I-X. Weimar, im Verlage des Landes-Industrie-Comptoirs. 1802.

8°: viii, 40 p., 10 hand-colored plates.

CONTENTS: [i-ii], Title page, verso blank.; [iii]-iv, "Einleitung."; [v]-viii, "Mikroskopisches Kabinet. "; Taf. I. No. 1-5. Krystalle (Grünspan, Küchensalz, Salmiak, etc.); Taf. II. No. 6-10. Staubkörner (Orchisblume, Fichte Malve); Taf. III. No. 11-15. Staubkörner (Glasfaden, Menschenhaar, Seetang, etc.); Taf. IV. No. 16-20. Staubkörner (Milch, Blut, Gummigutt, etc.); Taf. V. No. 21-25. Blätter (Bastard-Indig, Johanniskraut Blattstückchen); Taf. VI. No. 26-30. Gliederhaare (Staubfäden der Tradescantie); Taf. VII. No. 31-35.

BERZELIUS

Wespennestes, Hornissennestes, Röhren.; Taf. VIII. No. 36-40. Silberfarbner Ueberzug des Oleasters.; Taf. IX. No. 41-45. Zarte Bruchstücke (Kalkspath, Bleyglanz, etc.); Taf. X. No. 46-50. Kleine Erdschneckchen, Schuppen.

VERY RARE. All published? This is an illustrated work of natural objects examined under the microscope. Included in this first section is a description with illustrations of various crystallized mineral specimens.

BERZELIUS

BERZELIUS, Jöns Jakob. (BORN: Väversunda, Östergötland, Sweden, 20 August 1779; DIED: Stockholm, Sweden, 7 August 1848) *Swedish chemist & mineralogist.*

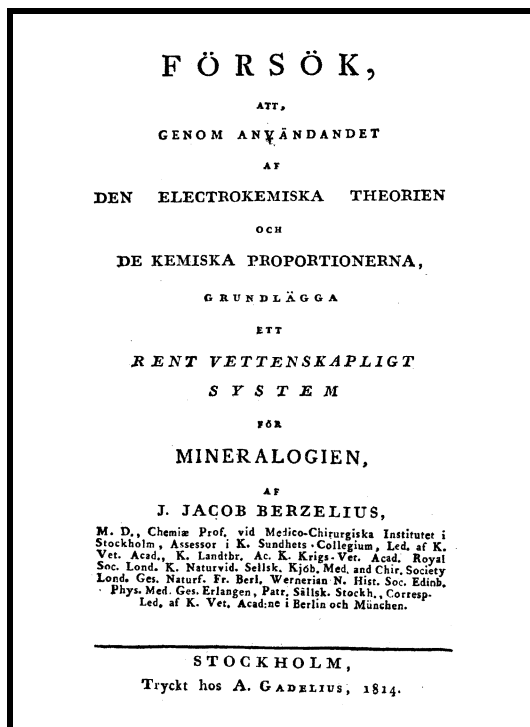

Berzelius studied medicine and chemistry at the University of Uppsala, from which he graduated 1804. In 1806, he was appointed professor of chemistry at the University of Stockholm. He became a prolific researcher and editor. In 1810, Berzelius was elected president of the Academy of Science. He was greatly distinguished by his skill and precision as a chemical analyst (probably the best of his generation), and he contributed much to advance the atomic theory first stated by Dalton by proposing a chemical nomenclature based upon it.

(i.e., 102), Text.

RARE. The central premise of Berzelius' chemical theory was the duality of chemical compounds, in which he rigidly classified compounds and their components as either electronegative or electropositive. In the *Försök*, Berzelius for the first time gives an outline of his theory as it applies to the problem of mineral classification. Because distinguishing the elements of all compounds as either electronegative or electronegative, and giving to every element a place in a series, and a place defined by the degree of these relations, it seemed to provide a rigorous and complete principle of arrangement. Accordingly in the *Försök*, Berzelius arranged minerals by their electropositive element, and the elements according to their electropositive rank, thus supposedly removing all that was arbitrary and vague in previous chemical classifications of minerals.

Minerals are nothing more than naturally occurring chemical combinations, and in applying his theoretical structure, Berzelius was in the eyes of many contemporaries, attempting to subjugate the science of mineralogy to a branch of chemistry. This caused rather strong arguments to rage in the scientific journals of the period as to the appropriateness of Berzelius' theory. This became especially evident when the discovery of isomorphism showed that bodies containing very different electropositive elements could not be distinguished from each other. It was therefore impractical to place them into different sections of the classification. Thus, this first system of Berzelius crumbled.

Berzelius would not concede defeat, and after confessing the flaw of his first system, he proceeded to realign his system to be based upon the electronegative element. This inversion of the system was an attempt to preserve the duality principle of arrangement. Thus, instead of arranging metallic minerals according to their metal under iron, copper, lead, etc., all carbonate minerals came into one category, while all oxides were classified together in another section. This was a great improvement over the previous effort, and eventually, the correctness of Berzelius' revised method was recognized, and improved upon. To this day, it is one of the cornerstones on which modern mineral classification rests.

German, 1815: A translation in German was published serially in Schweigger's *Journal für Chemie und Physik* as "Veruch, durch Anwendung der electrisch-chemischen Theorie und der chemischen Proportion-Lehre ein rein

wissenschaftliches System der Mineralogie zu begründen" (see: 11 (1814), 193-233, 12 (1814), 17-62 & 15 (1815), 277-300). The first two installments were translated by A.F. Gehlen and the last by W. Pfaff. The third installment consisted of five appendices that were part of the Swedish original of 1814. Once the publication was completed a very rare Sonderabdruck was made in a small edition and it consists of the first two installments only. It bears the title:

Versuch | durch Anwendung | der | electrisch
chemischen | Theorie | und der | chemischen
Verhältnisslehre | ein | rein wissenschaftliches | System
der Mineralogie | zu begründen | von | J.J. Berzelius. |

ATTEMPT, 1814

BERZELIUS

535. — English, 1814.

An | Attempt | to Establish | a Pure Scientific System | of | Mineralogy, by application of the Electro-chemical Theory | and the | Chemical Proportions, | By | J. Jacob Berzelius, M.D. F.R.S. | Professor of Chemistry at Stockholm. | [double rule] | Translated from the Swedish Original | by | John Black. | [double rule] | London: | Printed for Robert Baldwin, 47 Paternoster Row; and | William Blackwood, Edinburgh. | [rule] | 1814.

8°: A-I⁸; 72*l*.; [1]-144 p. (including 6 pages of advertisements at end). PAGE SIZE: 190 x 115 mm.

CONTENTS: [1]-2], Title page, verso C. Baldwin, Printer ...; [3]-4, "Advertisement."; [5]-108, Text.; [109]-118, "Appendix I."; 119-121, "Appendix II."; 122-124, "Appendix III."; 125-133, "Appendix IV."; [134]-138, "Appendix V."; [139]-144, "Scientific Books Printed for Robert Baldwin and for William Blackwood."

VERY SCARCE. Berzelius sent a copy of the Swedish edition to Thomas Thomson with the request that Thomson have it translated into English, correct the translation and have it published. This Thomson did, having engaged the services of one John Black to render the translation. Berzelius was dissatisfied with the quality of the translation remarking in the French edition of 1819 "The English translation... is made unfortunately by someone that has no notion of mineralogy probably, because she/it is full of mistakes; and in many of places original's sense is all to - fact disfigured. She/it appeared dependant preceded of one preface of the doctor Thomson, that assured to have him confronted to the original, and that she/it was perfectly faithful."

English translation by John Black from *Försök, att, genom användandet af den elektrokemiska Theorien* (Stockholm, 1814); the whole production supervised by Thomas Thompson, who also wrote the introduction. This is the first appearance in English of calculating the compositions of minerals on the basis of atomic theory, i.e. the law of multiple proportions and also of Berzelius' system of chemical symbols and formulae using the initial letters of the latinised names of the elements, and indicating the proportions of atoms present calculated according to the atomic weights, which has since been established as the standard form of chemical notation.

Owing to the lack of mineral knowledge on the part of the translator Berzelius' work was ill received in England. In fact a reviewer called the work "the most devoted sacrifice to experiment to hypothesis which the modern history of chemistry presents. Berzelius' theory is the measure of his facts, and like the Grecian robber who extended his victims upon his bed, and cut them shorter, if they were too long, or stretched them, if too short, this chemical Procrustes screws his results to the preconceived limits of an empirical axiom."

John Black. (BORN: ; DIED:) *English translator.*

MINERALSYSTEM, 1815

Mineralsystem

536. — Swedish, 1815.

Försök till ett rent kemiskt | Mineralsystem. | Af | D:r J. Berzelius. | Kem. Prof. R.N.O. | [rule] | Särskilt aftryck ur Afh. i Fysik, Kemi &c. | IV Delen. | [tapered rule] | Stockholm, 1815. | Tryckt hos Direct. Henrik A. Nordström.

8°: π^1 A-I⁸ K²; 75*l*.; [2], [1]-148 p. PAGE SIZE: 190 x 115 mm.

CONTENTS: [2 pgs], Title page, verso blank. [1]-148, Text.

RARE. After the publication of the original *Försök* in 1814, the noted mineralogist J.F.L. HAUSMANN wrote a highly critical review of the work. This provoked Berzelius to publish the *Försök till ett rent kemiskt Mineralsystem* in 1815. With the addition of this supplementary monograph Berzelius' mineralogy no longer looked like an "attempt" but a fully developed mineralogy.

This is the separately printed expansion of Berzelius' mineral classification system, based upon the electropositive element. Whereas the *Försök* published in 1814 was a mere outline, the present title expands the theory to a full mineralogical classification. The work

was originally published in *Afhandlingar i Fysik, Kemi och Mineralogi* (see: 4 (1815), 1-148).

German, 1816: After its original appearance, Berzelius' chemical mineral system was soon thereafter translated into German by W. Pfaff and C. Gmelin and published as the article, "Versuch eines rein chemischen Mineralsystems" in *Schweigger's Journal* (see: 15 (1815), 301-63 & 419-51 & 22 (1818), 274-302). A last installment, containing the notes to the systematic arrangement of the minerals as they appeared in the original Swedish (pp. 117-148), was published in *Schweigger's Journal*, under the title, "Anmerkungen zu der Abhandlung: Versuch eines rein chemischen Mineralsystems." Aside from these notes, the monograph contains four parts: the first (pp. 301-23) offered direct responses to Hausmann's criticisms, the second (pp. 323-36) presented further articulations of the chemical and mineralogical concepts, the third (pp. 337-63) contained a critical discussion of previous mineral classifications, and the fourth (pp. 419-51) presented the full mineral system. The separate German edition of the mineralogy was issued as a very rare Sonderabdruck of the 1815 translations by Gmelin and Pfaff. It contained the notes which appeared in it before they were published in *Schweigger's Journal*. It bears the title:

Neues | System der Mineralogie | von | J.J. Berzelius. | Aus dem Schwedischen übersetzt | von | Dr. Chr. Gmelin und Prof. W. Pfaff. | [ornate rule] | [rule] | Einzelner Abdruck dieser im Journal für Chemie und Physik | Bd. XV. Mitgetheilten Abhandlung. | [tapered rule] | Nürnberg, 1816. | bei Johann Leonhard Schrag. p¹ 1-88 97 103; 76 leaves.; [2], [1]-148, [2] p. Leave size: 216 x 108 mm.

[2 pgs], Title page, verso blank.; [1]-148, Text.; [2 pgs], "Verbesserungen."

Rare. Pfaff provides a translation of Berzelius' electrochemical theory, while Gmelin gives a detailed examination of Berzelius' chemical mineral system.

Christian Gottlob Gmelin. (BORN: Tübingen, Germany, 12 October 1792; DIED:) *German physician.* Gmelin was a medical doctor, who had taken a long trip throughout France, England, Germany, Norway and Sweden, where he became a student of Berzelius. He was appointed in 1817 a professor of chemistry and pharmacy at the University of Tübingen.

Johann Wilhelm Andreas Pfaff. (BORN: Stuttgart, Germany, 5 December 1774; DIED: Erlangen, Germany, 26 June 1835) *German mathematician.* Pfaff was a professor of mathematics at the University of Dorpat (1803-9), then at the Real-Institute in Nuremberg (1809-17), then the University of Würzburg (1817-8) and finally at the University of Erlangen (1819-35).

SCARCE. This translation was prepared by ANDRÉ JEAN MARIE BROCHANT DE VILLIERS from both the *Försök, att, genom användandet af den elektrokemiska Theorien* (Stockholm, 1814) and the *Försök till ett rent kemiskt Mineralsystem* (Stockholm, 1815). Brochant alters the text in minor ways, and adds new mineral analyses and many more notes than appeared in the 1815 monograph. It was prepared while Berzelius was visiting Berthollet at Arcueil in 1818-19, and incorporates new information Berzelius supplied to the translator. This was a tremendous improvement over the other translations, and it is the definitive statement of Berzelius' chemical mineralogical classification.

Another translation: A bad translation of Berzelius' theory that appeared in the *Journal de Physique* (see: 1 (1815), 86).

Work on Blowpipes

539. — Swedish, 1820.

Om | Blåsrörets | Användande | i | Kemien och Mineralogien. | [tapered rule] | Af | Jac. Berzelius. | [ornate rule] | Stockholm, 1820. | Tryckt hos Direct. Henr. A. Nordström. | På eget Förlag.

8°: π^5 A-T⁸; 157 ℓ .; [10], [1]-302, [2] p., 4 folding plates (showing 35 figures of blowpipes and apparatus). PAGE SIZE: 185 x 115 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [1 pg], Dedication to Herrar Ledamöter af Bruks-Societeten.; [1 pg], Blank.; [4 pgs], Preface, not titled.; [2 pgs], "Innehåll."; [1]-296, Text.; 297-302, "Register."; [2 pgs], "Förklaring öfver Tabellerna." [Description of figures on plates]; [At end], 4 folding plates.

SCARCE. Berzelius was instructed in the use of the blowpipe by the greatest living practitioner of the period, Johann Gottlieb Gahn. Every summer between 1812 and 1816, Berzelius visited Gahn in Falun. Together they would visit the famous mineral localities of the area, and every new find was subjected to analysis back in Gahn's laboratory. There, Berzelius learned a great deal of the methodology of blowpipe technique. During a journey through England and France in 1819, he had occasion to instruct Parisian mineralogists such as Cordier, Bronigart, Brochant and Beudant in the use

OM BLÅSRÖRETS, 1820

of the blowpipe, and before Berzelius left Paris he had promised to write a manual on the use of this important tool.

On his return to Sweden, he kept his promise by authoring the classic book, *Om Blåsrörets Användande i Kemien och Mineralogien* (Employment of the Blowpipe in Chemistry and Mineralogy). In it, he summarizes all aspects of blowpipe analysis in clear and simple language. Berzelius describes seven different types of blowpipes in detail as well as a special oil lamp of his own design. He distinguishes four zones of the blowpipe flame, and was the first to use the terms "oxidation" and "reduction" in the modern definition. In 1809, Wollaston had successfully isolated platinum, and this enabled Berzelius to describe his use of the metal in making dishes, crucibles and spoons for use in his experiments before the powerful blowpipe flame. He introduces the use of hydrogen fluoride as a reagent, and describes the reactions and reductions of the newer elements.

Johan Gottlieb Gahn. (BORN: Ovanåker, Sweden, 19 August 1745; DIED: Falun, Sweden, 8 December 1818) *Swedish chemist*. Gahn was successively consultant (1768), mining master (1782) and assessor (1784) at the Swedish Berg Collegium. He was also involved in the banking industry at Stora Kopparberget. Elected a fellow of the Academy of Sciences in Stockholm in 1784.

SCARCE. The first German edition of *Om Blåsrörets* (Stockholm, 1820), in excellent translation by H. Rose from the author's manuscript. Rose had worked in Berzelius' laboratory, 1818-21, and was clearly familiar with the material documented in the book.

Heinrich Rose. (BORN: Berlin, Germany, 6 August 1795; DIED: 1864) *German chemist*. Rose earned his doctorate at the University of Kiel in 1821. Trained as an apothecary, he became a student of Berzelius from 1818-21, after which he was appointed a professor of chemistry at the University of Berlin. In 1833, he was elected a member of the Academy of Science in Berlin. Rose authored numerous chemical papers.

USE OF THE BLOWPIPE, 1822

English editions

548. — English, 1822.

The Use | Of The Blowpipe | in Chemical Analysis, | and in | the Examination of Minerals; | By J.J. Berzelius, | Member of the Academy of Sciences of Stockholm, &c. | [rule] | Translated from the French of M. Fresnel, | by J.G. Children, | FRS. L. & E., FLS., MGS., &c. | with a sketch of Berzelius' System of Mineralogy; a Synop- | tic Table of the Principal Characters of the Pure Earths | and Metallic Oxides before the Blowpipe, and Numerous | Notes and Additions by the Translator. | [double rule] | London: | Printed for Baldwin, Cradock, and Joy, | Paternoster-row; | and J. Mawe, Strand. | [rule] | 1822.

8°: a-b⁸ c⁴ B-Y⁸ Z⁴; 192ℓ.; [i]-xxxix, [1], [1]-343, [1] p., 3 plates, one table. PAGE SIZE: 210 x 128 mm.

CONTENTS: [i-ii], Title page, verso "C. Baldwin, Printer."; [iii], "Dedication to Humphry Davy."; [iv], Blank.; [v]-x, "Translator's Preface"—signed J.G. Children, March 1822.; [xi]-xv, "Note to the Reader."; [xvi], Blank.; [xvii]-xxxiv, "Sketch of Berzelius's Mineralogical Arrangement, By the Translator."; [xxxv]-xxxix, "Introduction by the Author."; [xxxx], Blank.; [1]-133, Text.; 134-335, "Description of the Phenomena presented by Minerals when exposed to the action of the Blowpipe."; [336], Blank.; [337]-343, "Index."; [1 pg], "Errata."

VERY SCARCE. First English rendition by J.G. Children from *De l'Emploi du Chalumeau dans les Analyses Chimiques* (Paris, 1821). A table facing page 118 is titled, "Synoptic view of the principle characters of the earths and metallic oxides before the blowpipe."

John George Children. (BORN: Ferox Hall, Tunbridge, England, 18 May 1777; DIED: Halsteadplace, Kent, England, 1 January 1852) *English mineralogist & zoologist.* Children was educated at Eaton and Cambridge. He was employed as curator of the mineral collection of the British Museum from 1816 until 1840. Elected a Fellow in 1807, he was a longtime secretary of the Royal Society.

549. American edition, 1845: The Use | of the | Blowpipe | in | Chemistry And Mineralogy. | By J.J. Berzelius. | [rule] | Translated | From The Fourth Enlarged And Corrected Edition, | by J.D. Whitney. | [rule] | Boston: | William D. Ticknor and Co. | M DCCC XLV.

8°: a⁶ b² 1-19⁶ 20⁴ 21¹; 128ℓ.; [i]-xv, [1]-237, [1] p., 4 folding plates. PAGE SIZE: 215 x 133 mm.

CONTENTS: [i-ii], Title page, verso "Entered according to Act of Congress, in the year 1845, "; [iii], Translator's preface.; [v]-ix, Introduction, signed J.J. Berzelius, July 1843.; [x], Blank.; [xi]-xv, "Contents."; [1 pg], Blank.; [1]-87, Text, part 1.; [88], Blank.; [89]-220, Text, part 2.; [221]-226, "Supplement."; [227]-230, "Behavior Of Urinary Calculi Before The | Blowpipe."; [231]-237, "Index To Part II."; [1 pg], Blank.; [At end], 4 folding plates.

SCARCE. Second English translation and the first published in America by Josiah Dwight Whitney from *Die Anwendung des Löthrohrs* (4th ed., Nürnberg, 1844). The enormous advances made in blowpiping as a means of determining the composition of minerals and ores by the celebrated Swedish chemist were deemed of such importance that this translation was prepared by Whitney to serve as an instructional work in the art within the

United States school system. Subjects treated include a history of blowpiping, apparatus, equipment, reagents, behavior of elements, and a main text treating specific tests. There is even a supplement for analysis of urinary calculi. The plates depict apparatus.

Josiah Dwight Whitney. (BORN: Massachusetts, 1819; DIED: 1896) *American geologist.* Whitney was state geologist for California from 1865 until 1882. In that capacity he made an extensive survey of the land with William H. Brewer, Clarence King, Lorenzo Yates and others. He authored a number of important books, including, *Metallic Wealth of the United States* (1854), *Mountain Heights in the United States* (1862), and *The Yosemite Book* (1868), a beautifully illustrated and rare book. In 1864, he measured the highest peak in the continental United States, which was later named a Mt. Whitney in his honor.

MINERALSYSTEM, 1847

550. — German, 1847.

J.J. Berzelius's | neues | chemisches | Mineralsystem, | nebst einer Zusammenstellung seiner älteren hierauf | bezüglichen Arbeiten. | [rule] Herausgegeben | von | C.F. Rammelsberg, | Dr. und Professor an der Universität zu Berlin. | als zweite Auflage von Berzelius's neuen System der

Mineralogie, aus | dem Schwedischen übersetzt von Dr. Chr. Gmelin und Prof. W. Pfaff. | [tapered rule] | Nürnberg, 1847. | Verlag von Johann Leonhard Schrag.

8°: [i]-vi, [2], [1]-262, [2] p.

CONTENTS: [4 pgs], Advertisements.; [i-ii], Title page, verso blank.; [iii]-vi, "Vorwort.": [1 pg], "Inhalt.": [1 pg], Blank.; [1]-262, Text.; [1 pg], "Gedruckt bei A.W. Schade in Berlin, Grünstr. 18.": [1 pg], Blank.; [4 pgs], Advertisements.

RARE. In 1847, towards the end of Berzelius' life, Gmelin, Pfaff and Rammelsberg, his former students and associates honored their colleague with the publication of this volume. It contains German translations of seven memoirs authored by Berzelius relating to the classification of minerals. Two of these memoirs refer to Berzelius' two classification schemes, the earliest based upon the electropositive element and the later which differentiated by the electronegative element. Other memoirs answer various critics of the classification scheme, while the last paper by Rammelsberg is a survey of the mineral kingdom upon the lines laid down by Berzelius.

BESLER

BESLER, Basilus. (BORN: Nürnberg, Germany, 13 February 1561; DIED: Nürnberg, Germany, 13 March 1629) *German apothecary & botanist.*

From 1589 to 1629, Besler was an apothecary and from 1594 a leading citizen of Nuremberg. He founded a natural history cabinet and a botanical garden. He is considered the best botanist of his time. His principle work in the field and that on which his reputation rests is the highly illustrated work, *Hortus Eystettensis* (1st ed., Nürnberg, 1613). It consists of large folio volume containing 366 exquisite plates with descriptive letterpress that picture about 1,000 plant species in full bloom.

FASCICVLVS RARIORVM, 1616

551. — Latin, 1616 [First edition].

[Contained within an elaborate engraved frame showing Besler's cabinet:] Fascicvlvs | Rariorum et aspectu dig | norvm Varii Generis Qvæ | collegit ei svis impensis | æri ad Vivvm incidi | curavit atqve | evvlgavit | vit | Basilius Besler Noriberg: Pharmaceuticæ | chymicæ & Botanicæ cultor et | admirator | Me trasuit hæc, alias asía, et sua quemque vosuptas, | Sea tibi mitto tua, Zoile mitte micam. | Anno ChrIstI DoMInI SerVatorIs VerI.

Oblong 4°: 25ℓ., consisting of an engraved title page and 24 engraved plates. A dedication leaf may also accompany some copies. The date of publication is derived from the title page chronogram, "Anno ChrIstI DoMInI SerVatorIs VerI." The title page is engraved by Hans Troschel after Peter Isselburg's design. PAGE SIZE: 220 x 310 mm.

CONTENTS: Engraved title page, verso blank.; 24 plates.

RARE. A suite of engravings by P. Isselburg and H. Troschel [see notes below] illustrating the contents of Besler's 'Wunderkammer' located in Nürnberg. This was among the first such natural history collections in Germany, and like its Italian counterparts contained all manner of natural objects. The engraved title depicts Besler showing a visitor his cabinet, while a servant advances offering a saurian skull. There are drawers labeled Conchylia, Fructus, Lapides, shelves with chameleons, shells, an auk's egg, dried eels, while hanging from the wall and ceiling are a sawfish skull, bird of paradise, unicorn horns, various serpents, and a blowfish. Other shelves support a

row of books, apothecary jars, branches of coral, etc. There is no text to the work instead there are 24 engraved plates illustrating the contents of the cabinets. Every illustration is named and some have short accompanying descriptions in Latin and German. The plates are grouped into 6 of Marina, showing specimens of wonder from the sea, 2 of Conchylia, showing remarkable shells, 6 of Fructus depicting seeds and fruit, 4 of Animalia picturing chameleons, crocodiles, snakes, an armadillo, etc. and 6 of Lapides, including fossils, corals, and minerals. Only the engraved title is signed Petrus Isselburg, but he is probably responsible for the design of all the engravings.

Peter (Petrus) Isselburg (Eisselburg). (BORN: Cologne, Germany, c1568; DIED: Bamberg or Nürnberg, Germany, c1630) *German draughtsman, engraver & printer*. Isselburg is thought to have been a student of Crispijn van de Passe I or another Netherlandish artist. His work is known from 1606, when he was in Cologne, primarily producing frontispieces and prints for Cologne printers. By 1610 he was resident in Nuremberg. His work encompassed a broad spectrum of subjects, including portraits of scholars, generals and secular and clerical princes. His city panoramas are of historical interest and are distinguished by great technical proficiency. He also left a large number of sheets with emblems, costumes and scenes from history. In 1622 he left Nuremberg, subsequently moving to Bamberg in 1623, where he became a printer (1625), then to Coburg c1626 and back to Nuremberg in 1630. He was regarded as one of the most important German artists in his day.

Hans Troschel (Tröschel). (BORN: Nuremberg, Germany, 21 September 1585; DIED: Rome, Italy, 19 May 1628) *German draughtsman & engraver*. Troschel trained in Nuremberg with Peter Isselburg, for whom he later worked. Emperor Matthias's Entry into Nuremberg on 3 July 1612 was one of his first works. Signed and dated engravings and drawings increased after 1616. He worked partly from his own drawings and partly after drawings by other artists. Besides portraits and coats of arms he engraved views of Nuremberg, genre scenes and themes. His drawings consist mainly of studies of heads and figures. In 1624 Troschel moved to Rome, where his work was influenced by Francesco Villamena.

552. 2nd edition, 1622: [Contained within an elaborate engraved frame showing Besler's cabinet:] Continvatio. | Rariorum Et Aspectu Dig- | norvm Varii Generis Qvæ | Collegit Et Svis Impensis | Æri Ad Vivum Incidi | Curavit Atqve | Evvulgavit | vit. | Basilius Besler Noriberg: Pharmaceuticæ, | chymicæ & Botanicæ cultor et | admirator. | Me trasuit hæc, alias alia, et sua quemque vosuptas, | Sed tibi mitto tuam, Zoile mitte meam. | Anno ChrIstI DoMInI SerVatorIs VerI. | Se VerI.

Oblong 4°: 33 leaves, consisting of an engraved title page, one leaf of dedicatory text and 31 plates. The date of publication is derived from the title page chronogram, "Anno ChrIstI DoMInI SerVatorIs VerI Se VerI" (Cf. Nissen-Zoological: no. 345). The title page is engraved by Hans Troschel after Peter Isselburg's design, and was used

in the publication of the first edition in 1616.

RARE. Although stated to be a 'Continuatio' on the title page, this is a reissue of the original 24 plates of the first edition of 1616, together with a modified title leave, 7 new engraved plates, and an engraved dedication leave in Latin that might in some cases be found in the 1616 edition. Therefore, the text consists of 31 plates illustrating natural history specimens, which are labeled in Latin and German. Besides the original plates, an additional 6 show Lapidēs and one more Fructus. The title engraving is reused from the 1616 printing, with only the wording of the title changed.

 [mushrooms].

RARE. The last published description of Beslers'
 remarkable 'Wunderkammer' written by Michael
 Rupertus von Lochner, and after his death, published
 as a lasting tribute by his father, Johann Henrich
 [see notes below]. This beautifully illustrated work,
 describes various objects of natural history contained in
 the collection started by Basilius Besler and continued
 by his nephew, Michael Rupert Besler. A beautiful
 portrait of Johann Henrich Lochner is used as a
 frontispiece. The text then presents descriptions
 of the objects pictured on the accompanying plates.
 These illustrate fruits, roots & berries, birds, lizards,
 salemanders, aligators, snakes, sharkss, fish, turtle,
 octopus, crabs, shells, starfish, sponges, corals, fossil
 shells, stones, fossil plants and fossil shark teeth. The 24
 plates originally published in Michael Rupert Belser's
Gazophylacium Rerum Naturalium (1st ed., Nürnberg,
 1642) [see next entry] are republished in this work,
 together with 16 additional.

Michael Rupert Lochner. (BORN: Nürnberg, Germany,
 c1696; DIED: Nürnberg, Germany, 1715) *German author.*
 Son of the physician, Johann Heinrich Lochner von
 Hummelstein, Michael authored six works before his

BESLER

premature death at the age of 19, including an account of Besler's Museum.

Johann Heinrich Lochner von Hummelstein. (BORN: Fürth, Germany, 8 February 1662; DIED: Nürnberg, Germany, 15 October 1720) *German physician.* He studied medicine at the Universities of Rostock, Kiel and Altersdorf, and then went on an extended trip to Paris, Leyden, Vienna and Padua to further extend his skills. Afterward he was appointed to a position in Altersdorf but moved on to Nürnberg where he opened a private medical practice. His knowledge of natural science lead to his appointment as director of the Akademie der Naturforscher (Academy of Naturalists) in Nürnberg.

BESLER, Michael Rupertus. (BORN: Nuremberg, Germany, 1607; DIED: Nuremberg, Germany, 1661) *German physician & apothecary.*

The nephew of Basil Besler, Michael had a medical practice and apothecary shop in Nürnberg. He was a scholar and collector, who assembled important collections of art, antiques and natural history.

GAZOPHYLACIUM, 1642

554. — Latin, 1642 [First edition].

[Engraved title within a curious engraved design:]
Gazophylacium Rerum Naturalium | E Regno
Vegetabili, Animali Et Minerali | Depromptarum,
Nunquam Hactenus In Lucem | Editarum,
Fidelis Cum Figuris Aeneis Ad Vivum | Incisis
Repraesentatio | Operâ | Michaelis Ruperti Besleri
| Medici Et Reipublicae Norib. | Physici Ordinarii
Et Offi- | cinarum Pharmaceuti- | carum p.t.
Visitatoris | Senioris. | Anno | MDCXLII.

2°: Engraved title page and 34 unnumbered engraved plates of plants, animals and minerals with names and brief descriptions in Latin. The curious design of the title page is a border arrangement of animals and symbols. PAGE SIZE: 430 x 320 mm.

CONTENTS: Engraved title page, verso blank.; 34 plates.

VERY RARE. Basil Besler's [1561-1629; see entry above] *Wunderkammer* was inherited by his nephew Michael Rupert Besler, who added to the cabinet. The work published here catalogs his additions. It is a treasury of natural objects from the realms of the vegetable, animal and mineral. It contains standard items including a unicorn horn, a beak of a hornbill, a bird of paradise, a carved nautilus shell, an 'Arcimboldo' grotesques of shells, pyritized ammonites, asbestos, 'ruin' marble, engraved gems and antique coins. Rare plants and birds are illustrated along with ethnological items such as a Brazilian Indian girdle made from nuts of the Brazilian tree *Cerbera ahowai*. The image of this plate was used for the border of Valentini's *Museum Museroum* (Frankfurt, 1714). The very attractive engraved title shows emblematic medallions, with a rhinoceros, a unicorn, an ostrich, an elephant, a cornucopia and flowers with in a walled garden, and an alchemical symbol. These plates were reissued in 1716 and again in 1733, with added letterpress title in red and black and in German and Latin, and a short descriptive text in Latin and German. The first two issues were without text.

BEUDANT

BEUDANT, François Sulpice. (BORN: Paris, France, 5 September 1787; DIED: Paris, France, 10 December 1850) *French geologist & mineralogist.*

Beudant was educated at the École Polytechnic in Paris. He was named professor of mathematics at the Lycée d'Avignon in 1811, before being appointed professor of physics at the Lycée de Marseilles in 1813. Beudant learned his mineralogy in 1814 when he was sent by Louis XVIII to England to collect the recently purchased mineral collection of Bournon. When a government sponsored expedition was made to the Balkans in 1818, Beudant was in the group as mineralogist and geologist. In 1820, he was appointed Inspector-General of the University. Beudant was elected a member of the French Academy of Science in 1824.

VOYAGE MINÉRALOGIQUE ET GÉOLOGIQUE, 1822

557. — French, 1822.

Voyage | Minéralogique Et Géologique, | En Hongrie, | pendant l'année 1818; | Par F.-S. Beudant, | [...3 lines of titles and memberships...] | [rule] Relation Historique. | [rule] Tome Premier. [-Quatrième.] | [ornament] Paris, | Chez Vredière, Libraire, Quai Des Augustins, N° 25. | [ornate rule] | 1822.

3 vols. and atlas. [VOL 1] 4°: [4], [i]-viii, [1]-560, [1]-42, [2] p. [VOL 2] 4°: [4], [1]-614 (i.e., 574, pages 569-574 misnumbered 609-614) p. [VOL 3] 4°: [4], [1]-659, [1] p. [Atlas] 4°: [4], [1]-4, [1]-16 p., 7 folding plates, 7 folding maps, one folding table. PAGE SIZE: Text, 260 x 200; Atlas, 285 x 215 mm.

CONTENTS: [Vol 1] [2 pgs], Half title page, "Voyage Minéralogique et Géologique, en Hongrie," verso "De L'Imprimerie d'Abel Lanoe."; [2 pgs], Title page, verso blank; [i-ii], Dedication to the King of France; [iii]-viii, "Préface."; [1]-550, Text.; [551]-560, "Table Analytique."—table of contents; [1]-42, "Table Alphabétique générale."; [2 pgs], "Fautes Essentielles à Corriger Avant la Lecture de l'Ouvrage."

[Vol 2] [2 pgs], Half title page, "Voyage Minéralogique et Géologique, en Hongrie," verso "De L'Imprimerie d'Abel Lanoe."; [2 pgs], Title page, verso blank; [1]-596, Text.; [597]-614 (i.e., 574), "Table Analytique des Chapitres et des principales observations contenues dans ce volume."

[Vol 3] [2 pgs], Half title page, "Voyage Minéralogique et Géologique, en Hongrie," verso "De L'Imprimerie d'Abel Lanoe."; [2 pgs], Title page, verso blank; [1]-644, Text.; [645]-659, "Table Analytique Des Chapitres et des Principales Observations Contenues dans le Résumé Géologique."; [1 pg], Blank.

[Atlas] [2 pgs], Half title page, "Voyage Minéralogique et Géologique, en Hongrie," verso "De L'Imprimerie d'Abel Lanoe."; [2 pgs], Title page, verso blank; [1]-4, "Analyse des Cartes et Planches."; [1]-16, Extract of report on the book while in manuscript by Humboldt, Lelièvre, and Brochant.; [At end], 7 folding plates, 7 folding maps, and one folding table.

PLATES: The atlas contains 16 folded leaves of tables, maps and engraved plates. The maps are signed 'N. I. Rousseau, Graveur de la Chambre des Députés' or 'N. I. Rousseau Sculpit.' The last 3 maps occur in two states, with and without legends. All are bound as foldouts at the end of the atlas. Within the atlas are contained: [Table] "Tableau Géologique de la Hongrie" (folding). [Map] "Carte des divisions intérieurs administratives, militaires, etc. des Provinces Hongraises." (hand-colored, folding). [Cross-sections] Small plate of cross sections. [Plate I] "Détails Relatifs aux Terrains Primitifs, Intermediaires &c." (hand-colored, folding). [Plate II] "Détails Relatifs au Terrain de Siénite et Grünstein Porphyrique et au Terrain de Trachyte." (hand-colored, folding). [Plate III] "Détails Relatifs au Terrain de Siénite et Grünstein Porphyrique et au Terrain de Trachyte." (hand-colored, folding). [Plate IV] "Détails Relatifs au Terrain de Trachyte." (hand-colored, folding). [Plate V] "Détails Relatifs au Terrain de Trachyte." (hand-colored, folding). [Plate VI] "Détails Relatifs au Terrain Secondaires et Tertiaires." (hand-colored, folding). [Plate VII] "Détails Relatifs à la Contrée de Balaton; Terrain Basaltique." (hand-colored, folding). [2 Maps] "Carte Géologique de la Contrée de Schemnitz." (folding, 2 states). [2 Maps] "Carte Géologique des bords du Lac Balaton." (hand-colored, folding, 2 states). [2 Maps] "Carte Géologique de la Hongrie et de la Transylvanie avec une partie des pays limitrophes." (folding, 2 states).

SCARCE. This summary of the mineralogy and

geology of Hungary, is based on observations made by Beudant while conducting an extensive French state sanctioned exploration through the Austro-Hungarian Empire. It is the earliest and most detailed geological survey of the Balkans, including not only what is now Hungary, but also parts of Yugoslavia, Austria, Romania, Czech Republic, Slovakia and Russia. Within the atlas are a very detailed geological map of Chemnitz and its surroundings (now in Hungary) and also other areas such as Transylvania being the southern part of this important mining region on the Balkan. These are among the earliest geological maps of any part of the European Continent. Maclure is critical of the work, saying: "This whole work is a specimen of book making. All that can possibly be useful, in mineralogy or geology, might, with much ease, have been put into 50 pages, and the reader saved the labor of turning over from 1500 to 1800 pages of repetitions and descriptions of the same rocks, a thousand times over, creating confusion and fatigue, without leaving in the mind any defined ideas on the subject" (AJS, 7 1824). Sinkankas draws attention to Beudant's description of opal mines in the Dubnik area and his discussion of the opal.

TRAITÉ ÉLÉMENTAIRE DE MINÉRALOGIE, 1824

560. — French, 1824 [First edition].

Traité | Élémentaire | De | Minéralogie, | Par F.-S. Beudant, | [...8 lines of titles and memberships...] | [ornament] | A Paris, | Chez Verdière, Libraire, | Quai Des Augustins, N° 25. | [double rule] | 1824.

8°: π^2 a³ 1-52⁸ 53-55⁴; 433^ℓ.; [4], [i]-vj, [1]-856 p., one large folding table ("Table méthodique des espèces Minérales, d'après les principes minéralisateurs"), 10 plates (numbered Pl. I-X; showing mostly crystal drawings, some signed in a fashion similar to 'Adelmann del. N.L. Rousseau sculp.'). PAGE SIZE: 206 x 124 mm.

CONTENTS: [2 pgs], Half title page, "Essai | D'un | Cours Élémentaire Et Général | Des | Sciences Physiques. | Minéralogie," verso "De L'Imprimerie D'Hippolyte Tilliard."; [2 pgs], Title page, verso blank.; [i]-vj, "Préface."; [1]-326, Text.; [327]-826, "Tableau Méthodique | Des | Espèces Minérales."; [827], "Table | Du Poids Des Atomes Des Corps Simples."; [828]-829, "Table | Du Poids Des Atomes, Des Oxydes Et Acides | Avec Leur Composition."; 830-832, "Table | Du Poids des atomes, et de la composition des composés qui se | présentent le plus souvent dans le règne minéral."; [833]-[834], "Nouveau Goniometre."; [835]-856, "Table | Des Matières."

SCARCE. A highly regarded textbook, considered at the time of its publication to be the best authority in French mineralogy, and used in centers of higher learning throughout France. At its appearance it was the best treatment of Berzelius chemical classification of minerals. In the first portion, Beudant provides a comprehensive introduction to mineralogical science, including definitions, crystallography, physical and

chemical properties, nomenclature, and an overview of his system of classification. The bulk of the volume is a descriptive mineralogy arranged according to this classification. Tables at the end provide an analysis of the specific weights of simple bodies and acids and a description of a new form of gonimeter.

Earlier mineralogical investigations, particularly experiments with carbonates and other salts, showed Beudant a relationship between chemistry and crystal form that he expressed as Beudant's law. In essence, he discovered that when two compounds were dissolved within the same solution and precipitated together, the properties of the resulting crystal were determined by both substances. For example, the interfacial angle would have a value intermediate between the angles of the original compounds and proportional to the amount of the compound within the crystal. Within the *Traité* Beudant expands upon the relationship between chemistry and crystal form by developing a system of classification based on a mineral's chemical makeup.

The system Beudant adopts was a device of his own research in which he follows Berzelius and utilizes the electronegative component of the mineral to arrange it within the system. He begins by writing how unscientific the current state of mineralogy is, and his wish to remove everything arbitrary in classifying minerals. After surveying the various properties of minerals, he defines mineralogy as the "la réunion des minéraux de même composition." To present the idea to the reader, he ranks the known elements into three groups: *Gazolyten* (make volatile compounds), *Leucolyten* (produce uncolored oxide compounds) and *Chrocolyten* (combine into colored compounds). Under each of these groups are now creates subgroups based upon the minerals' electronegative element, taking into account isomorphic substances. Thus, mineral groups such as carbonates are found together in the system. Beudant provides supporting evidence for the correctness of the system by showing the similarity in physical properties of minerals within with in these groups, thus anticipating Gmelin who a short time later showed the influence of the electronegative element on crystal form and physical properties. Beudant then continues to subdivide the system into various series by his own analogies.

Beudant strongly believed chemistry and the conditions during a minerals formation determined its crystallography. He writes that the diverse crystal forms of the same substance was not mere chance, but controlled by the chemical conditions of the environment when the crystal formed. He points out that the same crystal forms are seen at different localities where analogous geological conditions are found. Conversely, when neighboring minerals and rocks were different, a different crystal form would also occur.

In the use of chemical formulae, Beudant accepted Berzelius idea of using symbols to describe elements within formulae of the mineral species, however, in the *Traité* he modified the symbols to be based upon the

BEUDANT

French names of the elements rather than the Latin proposed by Berzelius. Thus he wrote E (*Étain*), M (*Mercur*), O (*Or*), Ox (*Oxigène*), etc. Berzelius took exception to this display of French pride, and pointed out that if each nation were to do the same modification, all advantage to the precise communication among chemists would be lost. In the second edition of the *Traité*, Beudant changed his symbols so as to conform with the Latinized names of Berzelius.

VERY SCARCE. Scarce. This much expanded and improved edition reflects the tremendous strides mineralogy and chemistry made during the first part of the nineteenth century. Adopted by the Royal Council of Public instruction for the teaching in the royal colleges, this was the leading textbook in mineralogical science in France for many years. Volume one gives crystallography, properties, chemistry, classification, occurrences, economic mineralogy. Volume two is a descriptive mineralogy. Large folding tables showing the overall classification of certain mineral groups are bound into the second volume.

VERY SCARCE. Very scarce. Translation by Karl Friedrich Alexander Hartmann of *Traité Élémentaire de*

Mineralogie (Paris, 1824). "Literatur der Mineralogie," pp. [xxiii]-xxviii.

Carl Friedrich Alexander Hartmann. (BORN: Zorge near Walckenriedt, Harz, Germany, 8 January 1796; DIED: Leipzig, Germany, 3 August 1863) *German mineralogist, mining expert & metallurgist*. Hartmann was the son of a foundry official in the Oberharz, a prolific mining/mineral district in Germany. From these roots, he developed an early interest in mining and metallurgy, and through family connections secured a position as a student at the mining school in Clausthal, Austria. Although his studies were interrupted from 1813 to 1816 by a stretch in the German army fighting Napoleon, he resumed his education afterward, becoming an assistant to CHRISTIAN SAMUEL WEISS at the University of Berlin. In 1821, while still a student, Hartmann entered into a marriage that he could not financially support; therefore, he was obligated to leave the University and accept a bookkeeping position in Brunswick to provide for his family. His discretion and conscientiousness often meant being entrusted with important assignments. However, all spare time away from work or family was devoted to private study in the areas of geology, mining and mineralogy. His publications and translations in these fields brought him recognition and opportunities to travel throughout Europe. They also brought an appointment as commissioner of mines for Brunswick in 1825. Hartmann held membership in many scientific and technical societies, including Societät für die Gesamte Mineralogie of Jena and the Society for Mineralogy in St. Petersburg.

COURS ÉLÉMENTAIRE, 1840

Cours Élémentaire d'Histoire Naturelle

563. — French, 1840 [First edition].

Cours Élémentaire | D'Histoire Naturelle | a l'usage des collèges et des maisons d'éducation, | rédigé | conformément au Programme de l'Université du 14 septembre 1840; | par | mm. F.S. Beudant, Milne-Edwards, et A De Jussieu. | [ornate rule] | Minéralogie | Par M. F.-S. Beudant, | [...one line of titles...] | [ornate rule] | Ouvrage Adopté | Par Le Conseil Royal De L'Instruction Publique | Pour L'Enseignement Dans Les Collèges, | Et | Approuvé par Monseigneur l'Archevêque de Paris | Pour l'Enseignement Dans Les Établissements Belles Lettres. | [ornate rule] | Paris. | Langlois Et Leclercq, | Rue de La Harpe, 32. | [Vertical rule between publishers] | Victor Masson, | Place de l'École de Médecine, 2. | Mêmes Maisons, Chez L. Michelsen, A Leipzig. | [ornate rule].

12°: π^5 1-246 254; 153ℓ.; [i]-ix, [1], [1]-295, [1] p., illus. PAGE SIZE: 180 x 130 mm.

CONTENTS: [i-ii], Half title page, verso advertisement.; [iii-iv], Title page, verso blank.; v-vi, "Programme pour l'enseignement de l'histoire naturelle dans les collèges."; vii-ix, "Table analytique de matières par ordre de leçons."; [1 pg], Errata.; [1]-65, "Premier leçon. Différence entre les corps organisés et les corps bruts. Définition des minéraux. Objet de la minéralogie et de la géologie. Distinction des formes régulières et des formes accidentelles."; 66-91, "Deuxième leçon. Propriétés optiques des minéraux."; 92-120, "Troisième leçon. Composition chimique des minéraux."; 121-127, "Quatrième et cinquième leçon. Classification des minéraux."; 128-147, "Tableau des espèces minérales."; 148-288, "Description des minéraux les plus utiles à connaître."; 289-295, "Table alphabétique."; [1 pg], Blank.

VERY SCARCE. This heavily illustrated mineralogy text, a standard work and very popular in its day, was apparently first printed in 1840. It was subsequently reissued in France with new title pages proclaiming new editions for the next 46 years, and it had translations into Italian, German, and Polish. Apparently, only the first issues of the mineralogy were printed as separate volumes, usually without years. There after, the mineralogical text was combined with Beudant's *Géologie* (1st ed., Paris, 1840-1), creating a richly illustrated volume of mineralogy and geology, which changed little in its content during its long history of publication.

The introductory part of the volume is sectioned into five areas: (1) differences between organic and mineral bodies, providing definition and purpose of mineralogy and geology, (2) optical and physical properties of minerals, (3) chemical composition of minerals, and (4-5) the classification of minerals. A table of mineral species and a descriptive mineralogy follow. The book concludes with an index. Within the volume main topics include a survey of crystals and crystallography, odd crystallizations,

ideas on the internal crystalline structure, optical and physical properties, the chemical composition of minerals, mineral classification, and general observations. Illustrations show the goniometers of Wollaston and Babinet, a multitude of various crystal forms and combinations, double refraction, and minerals specimens.

The geological volume that is usually found bound with the mineralogy describes current phenomena (i.e., earthquakes, volcanic phenomena, outside agent influence), the application to the old phenomena (central heat - deposits attributable to sediments - to uprisings - volcanic action - erosion of waters), composition of the terrestrial crust, the phenomenon of crystallization, a survey of the geological composition of France, discussion on the geologic age of disasters, and the geological state of Europe.

BIRINGUCCI

Gemology Bibliography, 1993: no. 651. • *USGS Library Catalog*.

BIRINGUCCI, Vannoccio. (BORN: Sienna, Italy Born.; baptised, 20 October 1480; DIED: Rome, Italy, August 1539) *Italian metallurgist & chemist*.

As a young man, Biringuccio travelled throughout Italy and Germany, inspecting metallurgical operations, and working in them. After running an iron mine and forge at Boccheggiano for Pandolfo Petrucci, the ruler of Siena, he was forced to leave when Petrucci was overthrown. At some point he was in charge of a silver mine in Carinthia (until 1508). He was in Milan for a time and then in Ferrara in the service of Alfonso d'Este. When he returned to Siena with Petrucci, he was appointed (by Petrucci) to a post with arsenal at Siena and in 1513 director of the mint. In 1516, after the fall of the Petrucci family, he was exiled again. He returned with the Petrucci once more in 1523, and was exiled again in 1526. In the fighting in 1526 at Siena he commanded the artillery. Thereafter he served the Venetian and Florentine republics, and cast cannon and built fortifications for the Este and Farnese families. At some point he also served Pier Luigi Farnese, Duke of Parma. In 1531, with a new reconciliation he returned to Siena as senator and as architect and director of building construction at the Duomo. In 1534 he was appointed head of the papal foundry and director of papal munitions and captain of the papal artillery. His reputation is derived from the posthumous publication of his *Pirotechnia* (1540).

CONTENTS: [1 pg/=201r], Title page.; [1 pg/=201v], Dedication with a large device on the bottom half of the page.; [4 pgs/=202r-203v], "Tavola." (=table of contents); [10 pgs/=204r-208v], Text "Liber Primo."; ℓ. 1-ℓ. 168 (=A1r-X8r), Text.; [1 pg/=X8v], Blank.

RARE. Published posthumously, this book is

DE LA PIROTECHNIA, 1540

the first printed treatise covering the whole field of metallurgy, but it is also full of mineralogy, applied chemistry, gunpowder manufacture, military arts, typecasting and fireworks information. It is a practical work, mostly of original observations and based upon first-hand information gathered by the author during his lifetime of employment in mines, forges, mints, cannon foundries, and munitions works. Atypical of his time, Biringuccio is not prone to mystical speculation in his descriptions, and consequently the book is one of the most remarkable records of sixteenth century technology. Unfortunately, Biringuccio was gone by the time the manuscript reached publication, and consequently, some of the topics covered are not as clear as perhaps the author could have made them, had he lived.

The prologue of the text deals with the signs that indicate the occurrence of minerals. Among several indicators are the abundance of water since metals are formed in water and a test for mineralization by evaporating the water and subjecting the residue to assay by fire. Book I describes the ores of gold, silver, copper, lead, tin, iron, steel (which he thought was very pure iron) and brass. Book II covers the semi-minerals such as mercury, sulfur, antimony, marcasite, vitriols, alum, arsenic, orpiment and realgar, common salt, saltpeter, sal ammoniac, sal alkali, emery, borax, magnet, etc. Book III describes the preparation of ores for assaying and smelting. Book IV concerns the separation of gold and silver, with detailed instructions

for preparing nitric acid from saltpeter and pure alum. Book V describes common metal alloys and Book VI provides full instructions for casting bronze, including canon and bells. Books VII-VIII deal with foundry work, furnaces and casting. Book IX provides the first published description of the amalgamation process for extracting silver from its ores, by grinding in a mill with sublimate, verdigris, common salt, vinegar and mercury. Book IX deals with distillation, while Book X on pyrotechnics describes the preparation of incendiary mixtures, such as gun powder manufacture, bombs and other explosive devices.

Biringucci's description of metal alloys and their casting excels those of Ercker and Agricola, and his sections on glass, steel and the purification of salts by crystallization were copied by Agricola in his famous *De Re Metallica* (1st ed., Basileae, 1556). For its account of the methods of casting medallions, statues, and bells, the *Pirotechnia* is important in art history. Its also contains an important account of typecasting. In chemistry Biringucci includes the first account of silver amalgamation, and early descriptions of antimony, cobalt blue and manganese.

Facsimile reprint, 1914: *De la pirotechnia, 1540. Edizione, critica condotta sulla prima edizione, corredata di note, prefazioni, appendici ed indici, ed ornata dalle riproduzioni del frontespizio e delle 82 figure originali a cura di Aldo Mieli.* Vol. I. [All published]. Bari, Società Tipografica Editrice Barese, 1914. lxxxv, 198 p., illus. Published as: *Classici delle Scienze e della Filosofia. Serie Scientifica*, 1.

This was to be a definitive modern edition, but unfortunately ended with chapter 6 of Book II. A valuable account of Biringucci's life and analysis of the background and contribution of the *Pirotechnia* are included.

Facsimile reprint, 1977: *De la pirotechnia 1540. Vannoccio Biringuccio a cura di Adriano Carugo.* Milano, Il polifilo, 1977. 8°: lxxxvii p., 168 l., illus. Includes index. Bibliography, p. lvii-lviii]. Reprint of 1540 first edition, with an introduction in Italian and English.

German transl., 1925: *Pirotechnia. Ein Lehrbuch der chemisch-metallurgischen Technologie und des Artilleriewesens aus dem 6. Jahrhundert. Uebersetzt und erläutert von Otto Johannsen.* Braunschweig, Vieweg, 1925. 8°: [i]-xvi, [1]-544 p., 85 illus. A complete translation of the 1540 first edition by Otto Johannsen.

French editions

595. French transl., 1st edition, 1556: *La pyrotechnie, ov art dv fev, contenant dix livres, avsqvls est amplement traicté de toutes sortes & diuersité de minieres, fusions & separations des metaux: des formes & moules pour getter artilleries, cloches & toutes autres figures: des distillations, des mines, contremines, pots, boulets, fusees, lances, & autres feuz artificiels, concernans l'art militaire, & autres choses dependantes du feu. Composée par le Seigneur Vanoccio Biringuccio Siennois. Et traduite d'Italien en François, par le feu maistre Jaques Vincent ... A Paris, Chez Claude Fremy a l'Enseigne S. Martin, rue S. Jaques, 1556.*

4^o: *4 a-z⁴ A-Kk⁴ Ll⁶; 234ℓ.; [4]ℓ., 228 (i.e., 230) numb.ℓ., illus. Title vignette.

RARE. although the royal privilege is dated 1552, this book was not published until 1556. It is a translation by "feu maistre" Jaques Vincent, and is dedicated to Jehan de la Marche. The text is excellently printed and the illustrations well copied. However, the translation is not particularly good, having omissions, condensations and misinterpretations. It was the three French editions that most English writers have used for source material, thereby providing a false interpretation of Biringucci's ideas.

598. — German, 1791.

Physisch-technologisches Handbuch. Oder vollständige Nachricht und Beschreibung aller Naturprodukte und ihrer Zubereitungen zu allgemeinen und besondern menschlichen Bedürfnissen ... von Karl August Bischof ... Mit Kupfern. Nürnberg, Im Verlag der Raspischen Buchhandlung, 1791.

2 parts in one volume. 8^o: xvi, 352, [4], 290, [26] p., 17 plates (including frontispiece).

VERY SCARCE. A textbook of technology for adolescents describing natural products and their industrial treatment. It is written in the form of a narrative in which a father instructs his son while traveling through different cities. The first part deals with agriculture, forestry, gardening, viticulture, fishing, hunting, mineralogy, ship building. art works (including a section on clocks and watches and one on glassmaking, both with illustrations), musical instruments, hydraulics. mining, and commerce.

The second part deals with the production of food stuffs, textiles, and leather, architecture, wood- and metalwork, gold and silver, pottery, oil production, paper making, soap and candle making, glass making, pharmacology, printing, bookbinding, engraving, electricity, and gunpowder.

BISCHOF, Karl Gustav Christoph. (BORN: Wörd near Nürnberg, Bavaria, Germany, 18 January 1792; DIED: Bonn, Germany, 30 November 1870) *German geologist & geochemist.*

Son of Karl August Lebrecht Bischof [see previous entry], he was educated at Erlangen. In 1819, he was appointed extraordinary professor and in 1822 ordinary professor of chemistry at the University of Bonn. He remained at that post until his death. He was elected a Fellow of the Geological Society of London. Bischof is regarded as the founder of geochemistry.

SCARCE. In 1848 Bischof began to publish his enormous *Lehrbuch der chemischen und physikalischen Geologie*, which soon became the standard geochemical text, and helped to found the studies of geochemistry and petrology. It supported a new line of thought, the 'neoneptunistic'. Bischof in his first volume is clearly a plutonist and opposed neptunist views; however, as the work progressed, and he made the intensive studies in connection with the *Lehrbuch*, he became more convinced of the large role water played in the geological process. His discussion of this role and the thoughts put down in the *Lehrbuch* acted as a catalyst on further research in geochemistry and petrology throughout the 19th century, especially in Europe.

Having a chemical background made Bischof's experimental work eminently sound, although some of his generalizations as applied to petrology and the geological process failed. The first volume of the

Lehrbuch is concerned with various aspects of hydrology and the effect of water on rock surfaces, in pore and joint spaces, and in subterranean passages. His scientific account of springs is well illustrated with observations of such phenomena in the Rhine Valley. He was among the first to repudiate the plutonic theory for the origin of large salt beds, attributing them instead to the desiccation of large lakes as evidenced by the Dead and Caspian seas. He also investigated water as a chemical reagent under the regime of weathering, and also as a hydrothermal and hydration agent.

With respect to coal, Bischof concluded that the characteristic chemical and physical constitution of the different varieties of coal had been determined by the amount of air admitted and the accompanying heat and pressure. Thus he estimated that because of the substance lost in the process of coalification, it took 80 feet of plant material to yield three feet of coal.

The second volume of his work dealt with chemical mineralogy and petrology. Even today, the work retains its high value because of the numerous and careful rock analyses. However, his generalizations were formulated around the Neptunian Theory. Therefore he concluded that all rock minerals except augite and leucite could have originated from aqueous solutions under atmospheric temperature and pressure and that their origin from fused rock was exceptional. These conclusions were based on the similarity of the chemical composition of many volcanics with that of graywacke and slate. In one of his many experiments, Bischof melted large balls of basalt and by observations of their cooling period, he calculated that the complete solidification of the earth took 350 million years. Bischof, together with his contemporaries, Roemer, Goldfuss, and Vom Rath, made the University of Bonn one of the leading schools in geological research during the middle 19th century.

BIXBY, Maynard. (BORN: Vermont, U.S.A., 1853; DIED: Salt Lake City, Utah, U.S.A.?, after 1920) *American mineral dealer & collector.*

Bixby was a professional "rockhound" in the truest meaning of that description. He collected minerals from the Tintic and other Utah mining districts. These specimens, which he sold from his Salt Lake City premises at 539 Atlas Block, now reside in many of the world's finest museums. The mineral species "Bixbyite," which he first discovered, is named in his honor.

Bixby, 1914. • *Mineral Collector*: 4 (1898), no. 10, 159. • Personal communication [Wendell Wilson]. • U.S. Federal Census: 1920 [Salt Lake City, Ward 1, Precinct 5].

602. — English, 1902 [First edition].

A Catalogue Of | Utah | Minerals And Localities | With Descriptive List, | And Notes for Collectors | —by— | Maynard Bixby. | [ornate rule] | Salt Lake City, Utah. | 1902.

8°: [1]-22 p. Printed wrappers. PAGE SIZE: 202 x 116 mm.

CONTENTS: [1-2], Title page, verso "Copyright, 1902, | by | Maynard Bixby."; [3]-22, "Mineral Localities."

VERY RARE. This pamphlet provides a list of minerals species together with their properties, which are found within the state of Utah. It is the first independent publication dealing with the minerals of

the region. One section of the text provides notes for collectors.

REFERENCES: NUC: 59, 221 [NB 0514066].

603. 2nd edition, 1902: A Catalogue Of | Utah | Minerals And Localities | With Descriptive List, | And Notes for Collectors. | -by- | Maynard Bixby. | Salt Lake City, Utah. | 1902. | [ornate rule] | by | Maynard Bixby. | (Second Ed.).

8°: [1]-23, [1] p. Printed wrappers. PAGE SIZE: 204 x 118 mm. VERY RARE.

CONTENTS: [1-2], Title page, verso "Copyright, 1902, | by | Maynard Bixby."; [3]-23, "Mineral Localities."; [1 pg], Blank.

REFERENCES: BMC: 6, 94. • NUC: [no copy listed].

604. 3rd edition, 1904: A Catalogue Of | Utah | Minerals And Localities | With Descriptive List, | And Notes for Collectors. | -by- | Maynard Bixby. | Salt Lake City, Utah. | 1904. | [ornate rule] | Copyright, 1902, | by | Maynard Bixby. | (Third Ed.)

8°: [1]-24 p. Printed wrappers. PAGE SIZE: 202 x 116 mm. VERY RARE.

CONTENTS: [1-2], Title page, verso "Copyright, 1904, | by | Maynard Bixby."; [3]-24, "Mineral Localities."

REFERENCES: NUC: [no copy listed].

605. 4th edition, 1916: A Catalogue Of | Utah Minerals | And Localities | With Descriptive List | And | Notes For Collectors | [rule] | By Maynard Bixby | Salt Lake City, Utah | Copyright. 1916 by Maynard Bixby | [rule] | Fourth Edition | Enlarged and Revised.

8°: [1]-32 p. Printed wraps. PAGE SIZE: 195 x 115 mm.

CONTENTS: [1], Title page.; [2], "Compliments of | R.H. Officer & Co."; [3]-13, "Localities Of Minerals."; 14-17, "Notes For Collectors Of Minerals."; 18-32, "Rare Minerals."

VERY RARE. Bixby's final and most complete compilation arranged along the same lines as the other editions was apparently given away as a promotional device by a Salt Lake City chemical company. This is indicated on the verso of the title page: "Compliments of R.H. Officer & Co."

Facsimile reprint, 1959: A Catalogue of Utah Minerals and Localities with Descriptive List, and Notes for Collectors ... With Index of Mineral Species added by the Utah Geological and Mineralogical Survey. Reprint No. 60, Utah Geological and Mineralogical Survey. Salt Lake City, Utah, reprinted May 1959. 8°: [4], [3]-32, [3] index, [7] adverts. p.

Scarce. This reprint has brief notes on Bixby and a reprint of the 4th edition of the *Catalogue* together with a complete index.

BLAKE, William Phipps. (BORN: New York City, New York, U.S.A., 1 June 1826; DIED: Berkeley, California, 22 May 1910) *American mineralogist, geologist & mining expert*.

Blake was educated at Yale (chemistry, Ph.D., 1852) and received an advanced degree from the University of

BLAKE

California at Berkeley (LL.D., 1910). From 1852 to 1854, he worked as a chemist for the New Jersey Zinc Company. In 1854, he was appointed geologist for the Pacific Railroad Survey, a post that occupied him until 1856. Blake then became a mining consultant. In this capacity he made an extensive examination of the mineral resources of North Carolina, and founded in 1859, the *Mining Magazine*, of which he was editor. At the behest of the government, he was among the first foreigners to examine from 1861 to 1863 the mineral resources of Japan. On his return he explored the Stickeen River region of Alaska, and discovered the Stickeen glacier. In 1864, he became state mineralogist for California. From 1895 until 1905, Blake was the professor of geology and mining as well as director of the School of Mines at the University of Arizona. He also took on the added responsibility in 1898 of becoming the territorial mineralogist for Arizona.

BLANK

BLANK, Joseph Bonavita. (BORN: Würzburg, Germany, 22 March 1740; DIED: Würzburg, Germany, 26 February 1827) *German naturalist, mineralogist & art collector.*

Blank was a member of the Franciscan order and professor of philosophy and natural history at the University of Würzburg. He was also appointed curator of the University's art and natural history collections. In this

position, he continued to successfully add to the collections, most especially when his own immense personal collections of art and natural history specimens were acquired by the University.

Naturalien-Cabinet in dem Minoriten sogenannten Franciscaner-Kloster zu Würzburg gesammelt und geordnet von Bonavita Blank ... Würzburg, F.X. Rienner, 1795.

8°: [4], [1]-230, [2] p., plan.

VERY RARE. Published anonymously, but attributed to Blank. This is a catalog of the large collection of natural history objects (minerals, plants, animals) and other items such as drawings, porcelains and other art objects housed at the Franciscan monastery at Würzburg (later to become part of the University of Würzburg collections?).

REFERENCES: BL: [no copy listed]. • BMC: 1, ??, • GV (1700-1910): 16, 339. • Jonathan Hill, Bookseller: cat. 39, no. 21. • Murray, *Museums*, 1904: 3, 284. • NUC: [no copy listed].

610. — German, 1802.

Kurzer Bericht über die Vermehrung und dermalige Einrichtung des Blankischen Naturalien-Cabinetes zu Würzburg, ... Würzburg, F.X. Rienner, 1802.

8°: [i]-xvi, [1]-119, [1] p.

RARE. A short account of Blank's personal natural history cabinet, which contained animals, minerals, birds, books, etc., together with a history of how the collection was brought together. Ultimately, his entire collection was acquired by the University of Würzburg.

REFERENCES: BL: [973.c.16.]. • Jonathan Hill, Bookseller: cat. 39, no. 21.

611. — German, 1810.

Handbuch | der | Mineralogie. | [rule] | Von | Dr. Joseph Bonavita Blank, | [...5 lines of titles and memberships...] | [tapered rule] | [tapered rule] | Würzburg. | Gedruckt bey Franz Ernst Nitribitt, Universitäts- | Buchdrucker. | [rule] | 1810.

8°: π^2 1-37⁸ 38³; 301 ℓ .; [4], [1]-596, [2] p. PAGE SIZE: 192 x 105 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [2 pgs], "Vorrede."—dated 21 April 1810.; [1]-596, Text.; [2 pgs], "Verzeichniss | der sinnstörenden Druckfehler."

VERY SCARCE. The author's complete introduction to mineralogy based upon the theories of Werner. It was intended to accompany Blank's lectures at the University of Würzburg, however a contemporary review of this work, states: "This work intended as an introduction to the author's lectures, has many defects.

HANDBUCH DER MINERALOGIE, 1810

For example, the author has often created mistakes in completeness by struggling to keep the the mineral descriptions brief. He also appears to have only a limited knowledge of so-called 'new discoveries,' and the discussion of the various external characters is not ordered logically."

REFERENCES: BL: • GV (1700-1910): 16, 339. • Leonard's *Taschenbuch*: 6, 309-10. • LKG: XII 185. • NUC: [no copy listed].

BLONDEAU

339. • Leonard's *Taschenbuch*: 5, 338-39. • LKG: XV 51. • NUC: [no copy listed].

613. 2nd edition, 1820: Joseph Bonavita Blank's Beschreibung seiner Musivgemälde. Nebst kurzer Nachricht von dem Kunstsale und einigen Zuwüchsen des Naturalien-Kabinetts ... Joseph Bonavita Blank ... Zweite, verbesserte und vermehrte Ausgabe. Würzburg, 1820

8°: xx, 268, [2] p., engraved frontispiece, one folding engraved plate.

RARE. REWORK COMMENTARY: Prepared by Franz Georg Benkert, this description of Blank's collection of paintings also contains supplementary material concerning his natural history cabinet.

The present work describes 61 landscape pictures (including a few portraits) and 133 bird pictures. In the introduction Blank gives a vivid account of his working methods and of a mammoth archive of naturalia collected on his travels and acquired from across the world, which he used in his work. None of Blanks work has endured the ravages of time and the only survivor in the Würzburg collection is a portrait of King Max I Joseph of Bavaria, executed by Blanks assistant Barbara Thein, and by a curious coincidence the frontispiece of the present catalogue. A first description of Blanks artistic output was published in 1796, the present edition is enlarged. Blanks Naturgemälde were displayed in the natural history cabinet of Würzburg University (whose curator Blank was and a description of which is appended). According to Thieme/Becker his work was a Europe wide attraction at the beginning of the 19th century.

MANUEL DE MINÉRALOGIE, 1827

BLONDEAU, Charles Félix. *French mineralogist.*

614. — French, 1827 [2nd edition].

Manuel | De | Minéralogie, | Ou | Traité Élémentaire De Cette Science D'Après | L'État Actuel De Nos Connaissances. | Par M. Blondeau. | 2^e Édition, | Entièrement refondue, mise dans un nouvel ordre, | et rendue plus complète et plus à la portée des gens | du monde par un grand nombre d'augmentations. | Par MM. D** et Julia-Fontenelle, | [...5 lines of titles and memberships...] | Ouvrage orné de figures. | Paris, | Roret, Libraire, Rue Hautefeuille, | Au Coin De Celle Du Battoir. | [rule] | 1827.

12°: π^2 1-38⁶ 392; 232 ℓ .; 1-2, [2], [1]-460 p., one folding table (p. 53, "Table | Des Principales Propriétés Physiques | Des Substances Métalliques"), one folding plate (p. 446, showing apparatus and crystal drawings). PAGE SIZE: 135 x 85 mm.

CONTENTS: 1-2, "... Collection De Manuels | Formant Une | Encyclopédie | Des | Sciences Et Des Arts, | ..."; [2 pgs], Title page, verso "Imprimerie De Marchand Du Breuil, | ..."; [1]-6, "Introduction."; [7]-426, "... Notions Préliminaires."; [427]-446, "Vocabulaire | De | Minéralogie."; [447]-460, "Table Des Matières."

SCARCE. Although called a second edition on the title page, this appears to be the first appearance of the text in print. It is revised by A.G. Desmarest [1784-1838] and the chemist Jean Sebastian Julia de Fontenelle [1790-1842], and was a popular textbook in its day delivering a standard approach to the study of mineralogy. The text covers basic definitions, crystallography, fracture, luster, hardness, color, optics, transparency, chemical composition, nomenclature, and mineral classification. A long section at the end provides a descriptive mineralogy.

According to the advertisement: "Entirely recast in a new order, and made more complete by a large number of augmentations."

620. — German, 1832 [First edition].

Taschenbuch | der | Edelsteinkunde | für | Mineralogen, | Techniker, Künstler und Liebhaber | der Edelsteine; | bearbeitet | von | Dr. J. Reinhard Blum. | [... 5 lines of titles and memberships ...] | [tapered rule] Stuttgart, | bei Carl Hoffmann. | 1832.

8°: xvi, 356 p., 6 lithographic plates (folding).

VERY SCARCE. Using his *Die Schmuck-Steine und deren Bearbeitung* (Heidelberg, 1828) as a foundation, Blum wrote this popular pocketbook of gemstones from a mineralogical standpoint. Taking advantage of recent discoveries in optical properties and other physical properties those mineral species that are deemed to be gemstones are fully and described. The first section of the book provides an overview of the properties and the determinative tests used to identify gemstones. Blum then gives a discussion of the lapidary art. The remainder and largest section of the book describes individual gemstone mineral species, giving synonyms, properties, occurrences, methods of lapidary treatment, etc. Blum's work was popular with three editions appearing.

Taschenbuch | der | Edelsteinkunde | für | Mineralogen, Techniker und Juweliere | bearbeitet | von | Dr. J. Reinhard Blum, | [...2 lines of titles and memberships...] | Dritte verbesserte Auflage. | [ornament] | Mit in den Text gedruckten Holzschnitten und sechs Steindrucktafeln. | [ornate rule] | Leipzig, | Verlagsbuchhandlung von Carl Wilferodt. | 1887.

8°: x, 341 p., 6 plates.

VERY SCARCE. A revised edition, containing information on the crystallography, physical, optical and chemical properties of gemstones. As in the earlier editions, Blum includes information on gemstone history, occurrences, nomenclature, lapidary treatment, etc., but now also includes notes on gemstone synthesis, imitation stones and inclusions. Sinkankas notes that this book was succeeded by Wilhelm Rau's *Edelsteinkunde* (1st ed., Leipzig, 1907; 6th ed., Leipzig, 1937).

LEHRBUCH, 1832

623. — German, 1832 [First edition, issue A].

Lehrbuch | der | Oryktognosie | von | Dr. J. Reinhard Blum, | Privat-Docent der Mineralogie an der Universität zu Heidelberg. | [ornate rule]

| [double rule] | Stuttgart. | E. Schweizerbart's Verlagshandlung. | 1832.

8°: [1]-486, [2] p. Published as volume two of the series, *Naturgeschichte der drei Reiche* by G.W. Bischoff & others. PAGE SIZE: 208 x 128 mm.

CONTENTS: [1-2], Title page, verso blank.; [3]-[4], "Vorwort," signed R. Blum, August 1833.; [5]-464, Text.; [465]-468, "Uebersicht | der | Mineralien nach ihren Kernformen."; [469]-486, "Inhalt."; [2 pgs], Publisher's list.

VERY SCARCE. This is the first appearance of Blum's popular textbook of mineralogy, which would go through four editions to 1874. Typical information about mineralogical subjects is covered in a well written style, that no doubt helped to introduce a complex subject to many students. Although some theoretical material is covered, Blum concentrates on the practical aspects of the science, deriving his text from Kobell's *Charakteristik der Mineralien*, Naumann's *Mineralogie* and Leonhard's *Oryktognosie*. For more detailed information, Blum refers the reader to one of the more advanced textbooks.

PSEUDOMORPHOSEN DES MINERALREICHES, 1843

RARE. The classic, fundamental work on pseudomorphs that has never been surpassed. The book begins with a review of previous research, discussion of the same, and the author's reasons for dividing pseudomorphs into the two broad classes of alteration pseudos and replacement pseudos. In detailed descriptions of 263 known pseudomorphs, Blum provides a thorough discussion of previous research, rich references, and locality information. Through this work, Blum was among the first to show the importance of chemistry in several pseudomorphic processes, especially in the replacement process, which was later shown to be one of the principle processes involved in forming economic ore deposits. This basic text was maintained and heavily augmented over the next 36 years by four additional supplements. See below for their descriptions.

4°: [8], 264 p., 8 plates (7 color). PAGE SIZE: 294 x 230 mm.

VERY SCARCE. Co-authored with Gustav Leonhard, August Hermann Seyfert and Edmund Söchting, this is a voluminous compendium of prize winning essays about inclusions found in minerals. A total of 334 types of inclusion-host pairs are

EINSCHLÜSSE VON MINERALIEN, 1854

recorded, and many old references to inclusions in minerals are cited (pp. 73-75, 141-150). Söchting summarized the prior work of Blum, Leonhard, and Bischof on the occurrence of minerals included in other minerals. Söchting also lists a number of minerals that have been found in quartz. Occurrences of asphalt, petroleum, and water in quartz are mentioned. He shows that the presence of inclusions with low melting or decomposition temperatures can be used to prove that the quartz in many cases could not have been deposited from molten condition. Also discussed are the occurrence of broken tourmaline needles in quartz.

BLUMENBACH

BLUMENBACH, Johann Friedrich. (BORN: Gotha, Germany, 11 May 1752; DIED: Göttingen, Germany, 22 January 1840) *German physician, biologist & naturalist.*

Blumenbach studied medicine at Jena and Göttingen, from which he received his M.D. in 1775. He was

appointed professor ordinary of medicine and anatomy at the University of Göttingen in 1778, where he had a 50 year career. Considered one of the founders of modern anthropology, Blumenbach was the first to divide the human species into five races, i.e., Caucasian, Mongolian, Malay, American and African or Ethiopian. Blumenbach was a member of about seventy learned societies. He was made a knight of the Guelphic order in 1821.

639. — German, 1779 [First edition].

D. Joh. Friedr. Blumenbachs d[e]r Med. Prof. ord. zu Göttingen Handbuch der Naturgeschichte ... Göttingen, J. C. Dieterich, 1779-80.

2 vols. bound in one. 8°: [14], [1]-559, [27] p., 2 plates (folding).

VERY SCARCE. A once very popular, much printed, ambitious and comprehensive work on natural history, covering all aspects including the kingdom of minerals.

Von den Säugethieren, Vögeln, Amphibien, Fischen, Insekten, Würmern, Pflanzen, Mineralien, Metallen, Versteinerungen etc. - Die Taf. mit Abb. der verschiedenen Würmer im menschlichen Körper in Orig.-Größe, der Blattrinde der Pirnblätter und merkwürdigen Kristallisationen der Mineralien.

In his other work, *Handbuch der Naturgeschichte* (1779), he presented a compelling argument that zoological classifications should and could be based on structures associated with an animals specific functions. With his approach, he made an important contribution to the development of comparative primate anatomy. He noted that humans possessed a unique suite of anatomical characteristics that proved they were exclusively designed stand and walk upright (Spencer 185). Blumenbach began to separate human beings from apes, suggesting that Homo be assigned to a different and separate zoological order. This technique of separation between humans and apes were widely adopted and continued to the mid-19th century.

Blumenbach view of the nature was a philosophical one; he searched for the causes of things, not satisfying himself with the mere counting and description of phenomena. He approached anthropology with the mind of the natural scientist. He recognised that, in the same way as domestic animals come in varieties, all known groups of mankind originated from one common, basic race, which he divided into five. His activity as a

BLUMENBACH

teacher comprised three fields of natural history: mineralogy, botany, and zoology, the latter being his main discipline.

Blumenbach's *Handbuch der Naturgeschichte* (1779) is the first authored on a anatomical-physiological basis. It went through many editions and was translated into many languages. Although Blumenbach tended to follow the Linnean system, this work ushered in a new era in natural history. It contains an abundance of new or hitherto insufficiently evaluated morphological and ecological findings, from which Blumenbach drew conclusions that led to a more modern concept of the plant and animal kingdoms. He concluded from the spread of certain parasites found only in the domestic pig that such parasites did not exist as long as pigs were not domesticated and that they could therefore not possibly have existed since the creation of the world. Such ideas, revolutionary in their day, were carefully presented in various places in the *Handbuch*, and were demonstrated by concrete examples.

In connection with the morphological analysis and geological dating of fossil plants and animals, Blumenbach developed ideas that were still unknown to most of the scientists of his day and were touched upon by only a few others, such as Soulavie. He came to the conclusion that there had been groups of plants and animals, now extinct, which could not be classified in the system of recent forms of life, and he even attempted to draw up a geological-paleontological time scale.

640. 2nd edition, 1782: *Handbuch der Naturgeschichte*. Zweyte durchgehends verbesserte Ausgabe. Göttingen, J. Chr. Dieterich, 1782.

8°: 3 folding engraved tables

VERY SCARCE. Cf. BMC NH, p. 179; Wood, p. 245 (both first edition of 1799); DSB II, pp. 203-205. Second revised and expanded edition of highly influential work on natural history that "ushered in a new era in the advancement of science" (DSB). In this handbook Blumenbach included a wealth of morphological and ecological findings. He stated for instance that parasites found in domestic pigs did not exist as long as pigs were not domesticated, and therefore they could not have existed since the creation of the world. Based on his morphological analysis and geological dating of fossil plants and animals, he said that certain forms of plant and animal life had not only become extinct but also could not be classified in the system of recent forms of life. Blumenbach therefore was one of the earliest thinkers to recognize the "historicalness" of nature (DSB). The *Handbuch der Naturgeschichte* was first published in 1799. It went through numerous editions and was translated into many languages. The three parts of the work, zoology, botany and mineralogy, are each accompanied by a folding engraved plate.

654. — German, 1806-11.

Beitrage zur Naturgeschichte von Joh. Fr. Blumenbach. Göttingen, J. C. Dieterich, 1806-11.

2 vols. 8°: Theil 1. Ausgabe 2, 1806. Theil 2. Ausgabe 1, 1811.

VERY SCARCE. Blumenbach's book *Beyträge zur Naturgeschichte* contains several essays on the variability of nature, a concept that was not understood very well. It also showed that the earth, with all its flora and fauna, had a very long history. Blumenbach was one of the earliest thinkers to recognise the historicalness of nature, and therefore occupies an important place in the history of evolution theory.

... | 10tes Heft. | Nro 91-100. | ... | 1810.

10 parts. 8°: 127 leaves, 100 engraved plates (9 hand-colored). PAGE SIZE: 206 x 122 mm.

CONTENTS: Heft 1, leaves: [1], Title page, verso contents.; [1], Preface, dated Göttingen, 7 April 1796.; [2], Description of plates 1-5.; Plates 1-10, each with one leave of descriptive text.; [1], Blank.

Hefts 2-9, each identically arranged, leaves: [1], Title page, verso contents.; text and plates.; [1], Blank.

Heft 10, leaves: [1], Title page, verso contents.; [1], Half title page, "Abbildungen | naturhistorischer Gegenstände," verso blank.; [1], Title page to the set, "Abbildungen | naturhistorischer Gegenstände | herausgegeben | von | Joh. Fried. Blumenbach. | Nro 1-100. | Göttingen | bey Heinrich Dieterich. | 1810," verso blank.; [3], Classified index to all plates.; [1], Contents list for Heft 1.; Text and plates, 91-100.; [1], Blank.

RARE. The ten Hefts described were reissued again in 1810 under a general title. This is an interesting little work pictures all aspects of nature in a series of 100 plates. Although a once popular work, its is today only of interest for its intrinsic and historic value, having made no significant scientific contribution. It contains descriptive text to each of the 100 plates, together with contents lists, that show depictions from the plant, animal and mineral realms of nature. The set title and other preliminary matter bound in Heft 10 were intended for the reader that wanted to have the separate parts bound into a single volume.

656. Collected edition, 1810: Abbildungen | naturhistorischer Gegenstände | herausgegeben | von | Joh. Fried. Blumenbach. | Nro 1-100. | Göttingen | bey Heinrich Dieterich. | 1810.

8°: 109 leaves, plates 1-100 (10 hand-colored).

CONTENTS: leaves, [1], Half title page, verso blank.; [1], Title page, verso blank.; [3], Classified index to the plates.; [1], Table of contents ("des Isten Hefts"); [1], Preface, dated Göttingen, 24 January 1810.; [2], Discussion of the anthropological plates 1-5; [100], Text, being one descriptive leave for each plate, 1-100.

RARE. The set title and preliminary is identical to that published in Heft 10 of the series; however, Heft 1 has been entirely reset with a revised preface. Due to evidence of wear in the typeset, Mengel believes this issue to have been printed from standing type rather than being bound up from old sheets. Hefts with later issue years are known to exist, indicating that distinctive editions of this work were also published in 1827 and 1830 and perhaps other years.

BOCCONE

BOCCONE, Paolo Sylvius. (BORN: Palermo, Italy, 24 April 1633; DIED: Palermo, Italy, 22 December 1704) *Italian botanist.*

Boccone was a longtime professor of botany at the University of Padua. He traveled widely throughout Europe collecting various natural species and attending scientific meetings. He is best remembered for an important flora of Sicily, *Icones & Descriptiones Rariorum Plantarum Siciliae* (Oxonii, 1674). Boccone was a pioneer in the description of the natural history of the Island of Sicily (particularly plants) and his works show the typical 17th century penchant for curiosities, destined for an imaginary or real Museum. He was a member of the Leopoldina Academy. When he became a Monk he adopted the name Silvius.

Della Pietra | Belzvar Minerale | Siciliana | Lettera Familiare | Di | D. Paolo Boccone | Panormitano, | Botanico del Serenissimo Gran Duca di | Toscana, scritta ad vn Vir- | tuoso, e | Dedicata | All'Illustrissimo Signor | Don Giacomo Rvffo | Visconte de Francauilla, &c. | Con le Virtù, esperienze, luoghi doue si produce, | fedì de' Medici, modo d'adoperarla, con al- | cune figure in rame, che dimostrano la | forma, e varietà di essa Pietra | Belzuare. | [ornament] | In Monteleone Appresso Domenico Ferro M.DC.LXIX. | Con Licenza de'Superiori.

4°: [4], [1]-30 p., including one nearly full-page engraving (p. 19) and one blank page.

VERY RARE. Printed by Domenico Antonio Ferro, this monograph describes the minerals found in the author's native Sicily, with special attention to their supposed medical applications. In particular, Boccone describes the virtues of the bezoar stone, a petrified secretion of an animal intestine. Boccone gives unusually careful descriptions of the sites where specimens are found, describes their structure and expounds on some medical applications for which he has received endoresements from Sicilian physicians. This work is also an example of a rare Monteleone (di Calabria) imprint (Printing came to Monteleone only in 1635!).

PLATES: Frontispiece shows a portrait of Boccone's head and upper torso in an oval frame. Text at the bottom reads: "D. Paulus Boccone, modó Sylvius, Inde | fessus Sculator Rerum Naturalium | Ætatis LXIII."

VERY SCARCE. Dedicated to Leopold the second, the text consists of some forty-six "Osservazioni" on particular topics in natural history addressed to as many different persons, all prominent individuals from throughout Europe, where Boccone traveled extensively. The first four describe a Sicilian earthquake of 1693. Other topics include alkali and medicinal earths, *Terra Lemnia*, manna, an urn containing ashes, and a balsamic liquor manufactured on the island of Malta, tarantulas and snakes and antidotes to their bite, regular periods of fevers, curious animals, the extraordinary effects of certain plants, mushrooms, common plants, Italian cheeses, *alum di Rocca*, and marine plants. Also included in the text are references to amber, description of an eruption of Vesuvius in 1694, and an account of the geology of Sicily.

Boccone presented a number of items to the Royal Society of London (see *The Philosophical Transactions Abridged*, 2 (1673), p. 116).

RARE. An extensive examination of the natural history wonders in the kingdoms of east and west Prussia. The first volume gives a general geography, anthropology, meteorology and history of the region. Volume two is a mineralogical description giving information on the minerals, mines, fossils, stones, etc. found in Prussia. The third volume is a botanical account of the land, while the fourth describes the indigenous animals, birds, amphibians and fish. The fifth and final part is a description of the insects and worms, as well as containing supplemental material to the other sections.

Contents: Band 1: welcher allgemeine geographische, anthropologische, meteorologische und historische Abhandlungen enthält. Band 2: welcher das unterirdische Preussen oder das Fossilienreich dieses Landes beschreibt. Band 3: welcher eine Beschreibung des Pflanzenreiches dieses Landes in sich begreift. Band 4: welcher die inländischen Säugethiere, Vögel, Amphibien und Fische beschreibt. Band 5: welcher die Beschreibung von einigen preussischen Insekten und Würmern ... liefert ... Mit 3 Kupfertafeln.

MVSÆVM BRACKENHOFFERIANUM, 1677

Every object found a place under one of these heads, and the text reveals most of his natural history specimens were mineralogical, which were consequently listed under Fossil. The divisions of this class included metals, stones, and mineralia media. The metals were divided between natural and artificial, while the subdivisions of the stones show the uncritical character of the mineralogy of the time. These were classified into: Lapidēs majores molles, stones taken from animals, meteoric stones, Lapidēs fossiles minores, Silices minores, petrifications including petrified wood, the petrified molar of an elephant, gems and precious stones, and corals. The mineralia media included the earths and sulphur. Among the animals a crocodile can be found. The vegetables stood by themselves. The primary division of Artificial items was into objects made of wood, glass or ivory, while other groupings included pictures, gold and silver work, works of art in marble, wax and other materials, antiquities and coins.

This is a luxuriant volume printed on fine paper stock in red and black throughout with marvelous typography. Although very rare, it attracted enough notice to have an abstract reprinted in MICHAEL BERNHARD VALENTINI's *Museum Museorum*, Frankfurt am Mainz, 1714, vol. II, appendix XX, pp. 69-81. In addition, several letters in FRANZ ERNST BRÜCKMANN's *Epistolæ Itinerariæ* reference Brackenhoffer's collection (See: 1, Epistola 39-47, 57-60, 64-65, & 81-84).

Élie Brackenhoffer. (BORN: Strasbourg, France, 27 March 1618; DIED: 1682) *French bibliophile.* French

bibliophile and noted humanist, Brackenhofer undertook several journeys throughout France, Germany and Italy. He developed a taste for collecting objects of all types, and built a large cabinet containing ancient coins, books, sculpture and art, and natural history. His coin collection was cataloged in 1665.

[Part V] [2 pgs], Blank, verso title page in German.; [2 pgs], Title page in Latin, verso blank.; [i]-x, "Praefatio. Vorrede."; [3], Sectional title page, "Pars V. | Hydrologi. | Fünfter Theil | Wasswerreich."; [4], Blank.; [5]-339, Text.; 400-431, Combined table of contents in Latin and German for the five parts.; 432-666, Name index to all parts.; 667-740, Index to the anonymous works listed in the bibliography.

RARE. Listing c65,000 books and articles, this massive compilation is a classified bibliographical guide to works on natural history published from the fifteenth through the eighteenth centuries. Entries often include references to reviews or other commentary. The complete five parts are arranged in nine volumes: Pars I, Scriptores generales (general works, 2 vols.), Pars II, Zoologi (zoology, 2 vols.), Pars III, Phytologi (phytology or plants, 2 vols.), Pars IV, Mineralogi (mineralogy, 2 vols.), and Pars V, Hydrologi (hydrology, one vol.). A lengthy name index (including a separate one for anonymous works) is included at the end of the last volume (pp.432-740).

The fourth section, published in two volumes concerns mineralogy and the earth sciences. This bibliography was compiled with much perseverance on the part of Boehmer, with the list, which is less complete with regard to non-Germans, extending to the year 1784. However, the compiler did not know mineralogy as a science. Consequently, the classification

of the entries is somewhat jumbled. For example, writings on mining, mine engineering, mining law, instruction on goldsmithing, glaringly occur with other titles about mineralogical systems. Additionally, many mineralogical works are listed in volume one devoted to general writings that includes a lengthy section concerning natural history collections and museums (1, pp. 369-411). None the less, Boehmer's bibliography of mineralogy ranks with Gatterer's *Allgemeines Repertorium der mineralogischen, bergwerks= und salzwerkwissenschaftlichen Literatur* (Giessen, 1798-9) as one of the best compilations of the 18th century, and although not stated, Gatterer clearly relied upon Boehmer's prior work in his compilation.

SCARCE. This work introduces and describes the use of stereographic projections in crystallography. This technique, still used today, plots the angles of a crystal form onto a special graph. This work includes discussions of angle measurement, polar coordinates, Wulff nets and their construction and how it is applied to the seven crystallographic systems. Examples of the stereographic projections are found in a back pocket.

VERY SCARCE. The "classic" mineralogy of Greenland, written at the beginning of the century, and considered valuable enough to have a revised English version prepared five decades later [see below]. The minerals found in Greenland are described in great detail, with exact information on localities and discoverers with complete references. The largest part of the work is a descriptive mineralogy of the 162 mineral species arranged according to PAUL GROTH's, *Tabellarische Uebersicht der Mineralien* (Münich, 1898). Under each are listed the localities and the person to first discover the mineral at that locality, literature, description of occurrence, crystal form, and other properties. Following the descriptive portion is a geographical listing of minerals in Greenland. The remoteness of the region and its unique mineralization make this an interesting and important topographical work.

It was the first attempt at describing the mineralogy of the region and as such it is the basis of all subsequent literature on the subject. Also importantly Bøggild thoroughly studied Greenland minerals in the collections in the Mineralogical Museum

of Copenhagen, which had systematically been collected but never before scientifically examined.

Museum Boltenianum | sive | Catalogus cimeliorum | e tribus regnis Naturæ | quæ | olim collegerat | Joa. Fried. Bolten, M.D. p.d. | per XL. annos. Proto physicus Hamburgensis. | [ornate rule] | Pars Secunda | continens | Conchyliia sive Testacea univalvia, | bivalva & multivalvia. | [ornate rule] | Hamburgi, | Typis Johan. Christi. Trappii.

2 parts. [Part 1] 8°: ?? p. [Part 2] 199, [2] p.

RARE. The Latin forward is written by Anton August Heinrich Lichtensten [see note below]. Afterward is a forward in German by the famous collector Peter Friedrich Röding clearly stating this publication was a solicitation to locate a purchaser for the collection. Apparently, no one was forthcoming [see next entry].

Bolten's library was cataloged for sale in 1796: *Bibliotheca Bolteniana sive catalogus librorum ... ex omni genere scientiarum praecipue autem historia naturali, anatomia, chirurgia & arte medica ... Joachim Friedrich Bolten*. (Hamburgi, Trapp, 1796).

Anton August Heinrich Lichtenstein. (BORN: Helmstädt, Germany, 25 August 1753; DIED: Helmstädt, Germany, 16 February 1816) *German theologian & naturalist*. Lichtenstein studied oriental culture, theology, philosophy, physics and natural history in Göttingen, Leipzig and Helmstädt. In 1775, he was appointed rector of the Stadtschule in

Helmstädt. A few years later he became rector at the Johanneum in Hamburg. In 1794, he also took on the role of city librarian. In 1799, Lichtenstein was appointed ordinary professor of theology at the city's University. He retired in 1810.

BOLTON, Henry Carrington. (BORN: New York City, New York, U.S.A., 28 January 1843; DIED: 1903) *American chemist & mineral collector.*

Bolton graduated from Columbia in 1862, and then studied chemistry in Paris, Heidelberg, Göttingen, and Berlin. In 1866 he received the degree of PhD from the University of Göttingen, his dissertation describing the fluorine compounds of uranium. He continued to travel before becoming in 1872 assistant in quantitative analysis in the Columbia School of Mines. In 1874 he became chemistry professor at the Woman's Medical College of the New York Infirmary, which he resigned in 1877. He was then appointed professor of chemistry and natural science in Trinity College, where he taught for the next decade. There he opened its new chemical laboratory, built an outstanding 3,000-piece mineral collection, and published a student guide to quantitative analysis, as well as a massive bibliography of the science.

| A Select | Bibliography | Of | Chemistry | 1492-
1892. | By | Henry Carrington Bolton. | [rule] |
Washington, D.C. | 1893.

8°: [i]-xi, [3], 1-1212 p.

CONTENTS: [i-ii], Title page, verso blank.; [iii], "Contents."; [iv], Blank.; v-ix, "Preface," signed H.

Carrington Bolton, 1 June 1893.; [x], Blank.; xi, "Number Of Title In The Seven Languages."; [1 pg], Blank.; [1 pg], "Explanation Of Abbreviations And Signs."; [1 pg], Blank.; 1-1158, Text.; 1159-1164, "Abbreviations of Titles of Periodicals."; 1165-1182, "Addenda."; 1183-1212, "Subject Index."

SCARCE. A massive and still useful bibliography of chemistry covering 400 years of material, that because of its broad scope lists many mineralogical titles. Bolton divides the material into seven sections: bibliographies, dictionaries, histories, biographies, chemistry, alchemy, and periodicals. Supplements were published to update the bibliography and add other titles missed.

VERY SCARCE. A thorough treatment of mineralogy. In the preface, Bombicci writes that advances in mineralogy have made this new edition a necessity. Volume one covers all facets of mineralogical science, including chemistry, physical properties, and crystallography. A large section is devoted to twisting and curving crystals and theoretical reasons why they occur. The author was an expert in this area and the chapters devoted to the subject are the best treatment to the time. In this period before the invention of x-ray analysis, the long discussion about the molecular structure within crystals and how atoms come together to create crystalline substances is especially interesting. The artificial production of crystallized minerals is also considered. At the end of the volume, Bombicci describes reasons for placing minerals species into a systematic order as well as the nomenclature applied to mineralogy. Volume 2 is mostly occupied by a descriptive mineralogy. Species are characterized by name, synonyms, chemical formula, localities. Many are also illustrated by crystal drawings showing their idealized forms. Volume 2 concludes with a list of authors mentioned in the text and a general index to the mineral species described.

| Nella quale si tratta delle cose più secrete, e più rare de' corpi | semplici nel mondo elementare, e de' corpi composti, | inanimati, & animati d'anima uegetatiua, | sensitiua, e ragioneuole. | Diuisa in Quattro Libri, e per maggior commodità de' | Lettori ogni Capitolo, c'ha potuto riceuerlo, | ordinato, con ordine d'Alfabeto. | Mandato in luce, e dedicato da Luigi Grotto | Cieco d'Hadria. | Con Licentia. | [vignette] In Venetia, | [rule] Appresso Fabio, & Agostin Zoppini Fratelli. | M. D. LXXXV.

8°: a⁸ A-O⁸; [8], 112 ℓ ., no pagination, 2 full page woodcut portraits (the author and the editor).

VERY RARE. Bondardo's *Riches of the World* is an interesting mineralogy that deals not only with minerals, metallurgy and related subjects, but with all the natural resources of the earth including plants and animals. It is divided into four books of which the first treats the earth, including the mountains, different kinds of water like rivers and oceans, air and lightning. Book two deals with metals, minerals, mines, etc.; the third book is concerned strictly with botanical issues; and the fourth deals with animals, including snakes, fishes and birds. There is a long passage in the third book on tobacco ("Negotiana") smoked by American Indians with a pipe made from stone. In addition several other references to America are made, but the title is not noticed by Sabin. The work is dedicated to Luigi Groto [1541-1585], who also edited the book. Two woodcut portraits are included, one of the author, the other of the editor. The basic text, apparently with little or no revision, was reissued at least five times until 1669. All editions of this work are rare.

BONDAROY, Jean de la Taille de.

See: *La Taille De Bondaroy, Jean De.*

BOODT, Anselmus Boëtius de. (BORN: Bruges, Belgium, c1550; DIED: Bruges, Belgium, 21 June 1632) *Belgian physician & mineralogist.*

Boodt was a member of a noble Roman Catholic family, and Anselmus seemed destined for a career in the administration of his native town. However, he elected to pursue a medical career and subsequently studied under Thomas Erastus [1523-1583] at Heidelberg and obtained his M.D. in Padua, Italy. He moved to Prague in 1583,

BOODT

where he was physician to the burgrave. While living there, he became acquainted with the Bohemian naturalist Thadeus Hayek. Through this relationship, Boodt became intensely interested in nature, and he began to draw and paint flowers, animals and minerals. He also made many mineralogical trips in Bohemia, Silesia and Germany. From 1584 until 1595, Boodt held the post of canon of St. Donat's Church in his home town, even though he continued to live in Prague. In 1604, Rudolf II took him on as his personal physician. Boodt continued in this position until the emperor's death in 1612. Boodt then returned to Bruges, spending the remainder of his life as a town councillor. He never married and his relatives received all the physical property, including a collection of minerals.

4°: †4 2†4 2†2 A-Z⁴ Aa-Mm⁴ Nn-Oo² Pp⁴; 165 ℓ .; [1]-[9], [11], [1]-294, [16] p. Woodcut portrait, 8 tables (2

GEMMARVM ET LAPIDVM HISTORIA, 1609

folding), woodcuts in the text, printer's woodcut device on title and at end. The folding tables, if present [see commentary], are bound in the text between pages 2/3 and 6/7. PAGE SIZE: 207 x 167 mm.

CONTENTS: [1-2], Title page, verso usually blank, but sometimes a portrait of De Boodt.; 3-[9], Dedication to D. Rvdolpho II, signed "Anselmvs Boetivs | de Boodt." [see commentary]; [3 pgs], "In | Commendationem Operis | Anselmi Boetii De Boodt | Brvgensis, de Lapidibus | Preciosis."; [2 pgs], "Ad Lectorem."; [6 pgs], "Catalogvs Lapidvm Omnivm | Qvorvm Mentio In Sequenti | libro sit."; 1-294, Text.; [15 pgs], "Index Rervm Et | Verborvm Memora- | bilivm."; [1 pg], Woodcut printer's device.

PLATES: In rare instances, a fine woodcut portrait of De Boodt is printed on the verso of the title page leave. The picture consists of an elaborate border with shields bearing family crests with the names printed above. This surrounds an oval frame that encloses a portrait of De Boodt's head, shoulders and chest. The wording on the frame is "Rvdolpho II. Roma. Imperatoris Medicvs Cvbicvlarivs. Anselmvs Boetivs De Boodt Brvgensis Belga I.V.L." The "n" in "Anselmvs" has been reversed. Underneath the frame is the wording, "Anagramma. Obstando sortiss casvs Delemvs acerbos. Hinc vni fidas, nam sic svmes Stabile Vno."

VERY SCARCE. *Gemmarvm et Lapidvm Historia* is one of the most important mineralogical works of the seventeenth century, marking a transition over previous lapidaries. It is of particular interest as a manual describing minerals that is more detailed, more extensive, more critical and more systematic than many earlier works. It was a well known and influential book, going through several editions and frequently being cited by other authors. A new era was marked with its publication. One in which the believes of the

past began to be challenged, and the researchers began to use hypothesis and experimentation to present new ideas. Above all, Boodt's work is an early example of a treatise on mineral substances that departs from a simple alphabetical arrangement in persenting its description of stones.

The work is divided into two books. Book one presents several general considerations relating to the properties of minerals. In book two, the major portion, are discussed over one hundred different mineral substances. For each kind, Boodt records the various names by which it is known, physical properties, occurrences, imitations, and the means of detecting imatations, uses emphasising medical prescriptions, and approximate cost. Contained within is an early attempt at the systematic description of minerals, with divisions of large and small, common and rare, soft and hard, flammable and nonflammable, transparent and opaque. Boodt notes the crystalline forms of some minerals as triangular, quadratic and heangular, and he provides critical references to earlier authors like Aristotle, Pliny and Parcaleus. Boodt was skeptical of the curative virtues of various gems. He suspected that it was coincidental that a specific type of gemstone was associated with a sick person who became well. Instead, he believed if stones had curative powers it was because they worked in concert with the body to affect a cure, not any supernatural property.

Discussing the properties of stones, Boodt gives a long discussion of hardness. He provides the earliest system of hardness grading for the various stones, which acted as a crude index to distinguish imatation gems from genuine. He distinguished three degrees of hardness and also included softness as a related but different property. Soft stones are considered such if fingers alone are sufficient to rub away the surface. Hard stones are called hard when they can neither be rubbed away with fingers nor cut by iron. Hard stones are classified under three categories: (1) a steel file can scratch the stone, (2) only the use of the Smyrna stone [emerald??] can cut the surface, and (3) those that can only be rubbed away with a diamond point.

Several states of the book appear to exist. In a descriptive bibliography, it is the writer's goal to provide details on the "ideal copy." That is the most complete copy that can be located. In this instance the volume described contains both the portrait and the two folding tables. This is indeed a rarity, and no single volume containing both has been found to examine. The description is a composite of two different books—one with a portrait, the other with tables. One could think that perhaps a volume with both the portait and tables does not exist; however, the German auction house of F. Zisska & R. Kistner in catalog 12/I for an auction held in October 1988 lists a De Boodt with both portrait and tables. This is undoubtedly a rare state. The more common state is where both the portrait and the tables are missing. Somewhere in between are copies with either the tables or the portrait, but not both. In addition, the publisher was apparently finding

and correcting errors in the text as the volume was produced. One copy found by Herbert Obodda, has the dedication signed "Anselmvs Boetivs | de Boodt," with the "t" and "d" swapped. Perhaps other states exist.

"Errata."

VERY SCARCE. A catalog of the collection of
Sicilian stones and minerals Borch had accumulated,
and which he has arranged into four classes: hard
stones, semi-hard stones, soft stones, and miscellaneous.
Under these headings, he describes various jaspers,
agates, concretions, marbles, alabasters, dendrites, cave
minerals, basalts, granites, serpentines, fossils, and
quartz crystals. In his introduction Borch describes
the mineral richness of the island of Sicily, and gives
incidental information on other local topics such as the
currency, local language, methods of measurement, etc.

Italian edition, 1777: An Italian edition is listed in
a few early bibliographies as *Conte di Borch Litografia di
Sicilia*. Napoli, 1777. However, no modern trace of this
title as been found in any of the great libraries of Europe
or America.

BORCH (Borrichius), Olaus. (BORN: Noerre Bork, in Ribe, Denmark, 7 April 1626; DIED: Copenhagen, Denmark, 13 October 1690) *Danish physician*.

Borrichius attended the schools of his home town before matriculating at the University of Copenhagen. Eventually he graduated with an M.D. from Angers. Starting in 1660 for six years he travelled and studied through Europe. Borch won fame as physician during a 1654 plague epidemic which led to his 1660 appointment as professor ordinary of philology, botany and chemistry. He became physician to the Royal household.

BOREL, Pierre. (BORN: Castres, Languedoc, France, 1620; DIED: Paris, France, 1689) *French physician, chemist & mineralogist*.

Borel studied medicine at Montpellier and opened a practice at Castres in 1641. In 1653 he went to Paris, where a year later he was appointed physician to the King. He actively studied throughout his life the fields of chemistry, optics, astronomy, philology and bibliography, and is known today for his writings on these subjects. Furthermore, he was an avid collector of all types of objects both natural and artificial, which during his lifetime he assembled into a large and varied cabinet. Borel was the first author to write a bibliography of chemistry *Bibliotheca Chimica* (Paris, 1653) and an early history of the telescope *De Vero Telescopii Inventore* (The Hague, 1656).

RARE. In part one of this work, Borel gives a history of Castres, France, his home town, which is a tract of considerable historical significance. Included are several chapters describing the minerals, flora and fauna of the surrounding area. Appended as the second part of the treatise is a catalog describing the contents of Borel's natural history cabinet that contained animals, plants, minerals, rarities, and musical and scientific instruments. Preceding the catalog is an 8 page list of other European museums and private collections arranged by city.

Ghost edition: The 1645 edition listed by some bibliographies is most likely a phantom.

BORLASE, William. (BORN: Pendeen, Cornwall, England, 2 February 1695; DIED: Ludgvan, Cornwall, 31 August 1772) *English naturalist & antiquarian.*

Borlase was born to an ancient family which could trace its roots back to the early Normans. His ancestors had settled in the parish of St. Wenn, Cornwall, where they adopted the Cornish name of their place of residence. He was first educated at a school in Penzance, but was moved to Plymouth. In 1712, Borlase entered Exeter College, Oxford, from which in due course, he earned the degrees of B.A. and M.A. In 1719 he was ordained a deacon of the church and in 1720 a priest. He was given responsibility of the parish of Ludgvan, near Penzance, where he seems to have first paid attention to the natural history and prehistory antiquities of the area. For his papers on the subject, he was elected to the Royal Society in 1750. Borlase published *Antiquities of Cornwall* (1st ed., Oxford, 1754) that contained many pertinent observations of district with respect to early human habitation. As his next book, he published a much enlarged version of an earlier paper *Observations on the Ancient and Present State of the Islands of Scilly, and their Importance to the Trade of Great Britain* (Oxford, 1756). This was followed by the *Natural History of Cornwall* (Oxford, 1758), which is described below.

BORN

Eventually, Borlase presented to the Ashmolean Museum of Oxford the whole of his collections of antiquities, fossils and minerals, which had been described in these works. In recognition of this generosity, the university bestowed a doctor of laws degree on Borlase, on March 23, 1766. Seven years later, he died, in the fifty-second year as rector of his parish.

VERY SCARCE. In this work, Borlase takes a generally conventional view of the Creation and Deluge in his descriptions of the natural wonders of Cornwall. Within the description are included many references to the diverse mineralogy of the region. He describes the lay of the land, air, weather, ground waters, rivers and estuaries, lakes and the surrounding sea, the earths, including soils, clays, steatites, etc., sands, husbandry, stones, including quartz, agates, jaspers, ornamental, spars, rock crystal, etc., semi-metals, bismuth, petroleum, antimony, manganese, loadstone, cobalt, mineral deposits and veins, metals, particularly tin and copper, birds, insects, fish, reptiles, quadrupeds and inhabitants. The map shows the region of Cornwall, and the other 28 plates picture various scenic vistas, crystals, figured stones, mines, apparatus, corals, insects, fish, shells, reptiles, and ancient coins.

Supplement, 1864: *Additions to Borlase's Natural History of Cornwall*. Royal Institution of Cornwall, 1864. 8^o: 66 p., fold out facsimile illustration of Borlase's hand writing.

This is a 'Supplement' to Borlase's regional work and has been prepared 'From MS Annotations by the Author.'

Facsimile reprint, 1970: *The Natural History of Cornwall, 1758*. Facsimile Reprint. With an introduction by Dr F.A. Turk. Biographical Essay by P.A.S. Pool. Appendix of additions from MS annotations by the author for a proposed second edition. 2^o: xix, 326 p., 64 p., folding map, 28 plates. Limited to 350 copies.

BORN, Iganx Edler von. (BORN: Karlsburg, Transylvania [now Alba Iulia, Rumania], 1742; DIED: Vienna, Austria, 24 July 1791) *Austrian mineralogist & metallurgist*.

Von Born was born to a German noble family. He was sent to Vienna at the age of thirteen to study with the Jesuits; however, he quickly decided that the monastic life was not in his future. Instead he went to Prague to study law. After graduation, Von Born made an extensive tour throughout Germany, Holland and France. During this period, he was exposed to natural history, including mineralogy and mining. In 1770, he joined the department of mines and the mint. Among his first official duties was a tour of the mines of Hungary and Transylvania. At one location, he descended into a shaft to soon after the fires to detach the ore had been extinguished, and was exposed to a near fatal dose of arsenic rich vapors. This experience caused Von Born sickly health for the rest of his life, and forced him to persue passive activities such as

BORN

his mineral collection. He was a dedicated Freemason and ardent anti-Jesuit. His work, *Specimen Monachologiae* (1st ed., Vienna, 1783) is a vicious attack against the Jesuit monks in which the various orders are classified according to a system modeled after Linneaus'. Perhaps this was revenge against his Jesuit experiences in Vienna when he was a youth.

RARE. This is a comprehensive catalog of Von Born's own large mineral and fossil collection. It is sometimes called by its half title, *Lithophylacium Bornianum*, and is based on Cronstedt's system. The publication of the first volume, which contains many new mineral descriptions, brought Von Born much critical acclaim from European mineralogists, as well as recognition from the Royal Court of Austria. On the strength of this reception, the author continued in 1775 the catalog's publication with the issue of a second volume, describing other minerals and petrifications in his possession.

The plates of volume one numbered I-III show

BORN

various figures of crystal clusters. The three plates of the second volume, also numbered I-III show crystal figures on the first plate, while the remainder figure various petrifications.

SCARCE. In 1770, in his capacity as an official of the department of mines and the mint, Von Born made a lengthy tour through the southern realms of the Austrian Empire. At that time, this encompassed the mineral rich lands of Hungary and Transylvania. His keen observations of the regions he travelled through were recorded in a series of letters Von Born sent to the Swedish mineralogist JOHANN JACOB FERBER. These letters contain a vibrant, warm

SCARCE. Translation by Rudolf Erich Raspe of *Briefe über Mineralogischer Gegenstände* (Frankfurt & Leipzig, 1774). This edition also contains a translation of Johann Jacob Ferber's *Beitrage zu der Mineral-Geschichte von Boehmen* (Berlin, 1774). The work by Von Born consists of a series of 23 letters addressed to Ferber describing the mining, geology and mineralogy he encountered on a trip through Hungary. Much of the text contain interesting observations on the production of copper, silver and gold. A map at page 84 shows Von Born's route through the territory. The last letter contains a valuable and interesting account of the various mineral collections visited during the trip. Ferber's text provides a mineralogical account of the region of Bohemia. Bound in at page 320 is a large folding map of the area with an indication of the various mining centers and geological features mentioned in the text.

Rudolph Erich Raspe. (BORN: Hannover, Germany, 1737; DIED: Muckcross, County Kerry, Ireland, 1794) *German geologist.* Raspe studied science and philology and worked as a librarian for several universities before fleeing to England in 1775 after pilfering some gems that were supposedly in his care. He worked at the Dolcoath Mine, Camborne, where he wrote his famous tale *The Surprising Adventures Of Baron Munchhausen* as well as discovering in St. Agnes a new tin-bearing sulphide, stannite. In 1791 he had to move again (to Ireland) after his involvement in a mining swindle in Scotland.

UEBER DAS ANQUICKEN, 1786

BORN

4°: [16], 227 p., 21 folding plates (designed by J. Frierer and engraved by J. Ziegler).

VERY SCARCE. Von Born invented an amalgamation process for extracting gold and silver from various ores. Since the process did not require the usual melting of the ore, it had considerable economic effect by not requiring any fuel. For his discovery, Von Born was given as a royalty a small percentage of the money saved where ever his process was used.

There is considerable information regarding the mining techniques used in Spanish America of the 16th century. Included are excerpts from the writings of Alvaro Alonso Barba [q.v.], José Acosta [?–?], among others.

733. — German, 1789-90 [Periodical?].

Bergbaukunde. [Edited by Ignaz von Born & Friedrich Wilhelm Heinrich von Trebra]. Leipzig: G.J. Göschen, 1789-90.

2 vols. [VOL 1] 4°: [8], 408, [12] p. [VOL 2] 4°: [4], 468, [4] p. Two fine & large mezzotint vignettes on titles, 13 folding engraved plates & maps, three folding printed tables, & one engraving in the text.

RARE. Co-edited by FRIEDRICH WILHELM HEINRICH VON TREBRA. In 1786 Born and Trebra were the founders of Szklono in Hungary of the Societät der Bergbaukunde, which had the purpose of increasing the knowledge in the areas of geology, mining, mineralogy, and metallurgy. It was an international scientific society and many of its members

were important names including von Heynitz, Lavoisier, Gmelin, Charpentier, Ferber, Poda, Hawkins, and Goethe. The *Bergbaukunde* was the first and only publication of the Society, which includes in the first part of volume one the plan and by-laws of the society. The remainder of the text contains numerous contributions on the mining activities and mineral resources of Germany, Hungary, France, England, Mexico, etc. The plates show various geological cross-sections, maps, illustrations of machinery, etc.

RARE. Edited by J.V. Degen [see note below]. From the editor's notes, it is learned that this book was privately printed for the friends and correspondents of Von Born, and limited to a total printing of 70 copies. Von Born was commissioned to prepare a catalog of the very fine mineral collection formed by Éléonore de Raab [see note below]. In the preface to the first volume, Von Born notes that this collection is one of the most complete of its kind. The specimens are described both by their exterior characteristics following Werner and by their chemical compositions in accordance with the theories of Lavoisier, Morveau, Fourcroy and Berthollet. Besides the typical information for each specimen described, the author includes many notes, comments, and references, showing that he was one of the ablest mineralogists of his day.

Jakob V. Degen. (BORN: Liedertswil, Switzerland, 1756; DIED: Vienna, Austria, 28 August 1848) *Austrian publisher.*

BIOGRAPHY NEEDED

Éléonore De Raab. *Austrian mineral collector.* (fl. 1790's) De Raab was the daughter of Franz Anton Ritter von Raab. She married the Spanish Ambassador della Huerta, and is sometimes referred to by early author's as "Frau von Uberta." De Raab owned a collection of about 2,500 small choice mineral specimens many of which had been given her by Von Born. In 1791 and 1792, De Raab purchased a suite of 41 mostly Cornish specimens from the English collector PHILIP RASHLEIGH. Eventually, De Raab's collection was acquired by the banker and art collector Count Moritz Christian Friess [1777-1826] of Vienna. In 1824, the Fries mineral collection was auctioned with the prominent buyer being Ferdinand Zimmerman, a professor at the Medicinisch-Chirurgische Josephs-Akademie.

8°: [i]-xiv, [1]-314, [2] p.

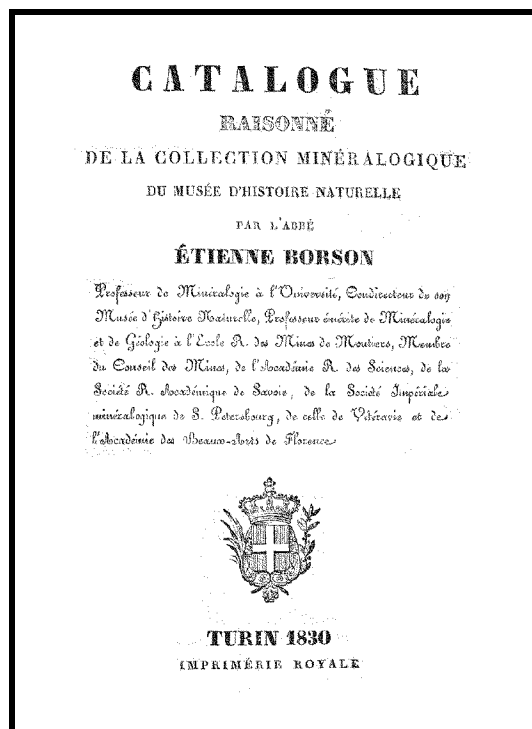

VERY RARE. No more published. First catalog of the large mineral collection accumulated by the Museum of Natural History at Torino, Italy [see note below]. Borson writes in the historical introduction that

he originally planned the classification of the minerals along the principles of Werner, but due to the progress of the science, he rearranged the collection according to the classification system of Brongniart. Other volumes were planned but none were published. The catalog was revised and completed in 1830, however [see next entry].

Turin (Torino), Italy. Museo Regionale di Scienze Naturali.

Italian museum. Founded 1730. The holdings of the mineral collection in Turin are the combination in 1800 of two earlier collections: (1) the University Natural History Museum (founded 1730) by Carlo Emanuele III, Duke of Savoy and King of Sardinia and (2) the Science Academy Museum (founded 1759). From 1805 until 1980 the mineralogical museum has been an autonomous institution operated by the University. In 1980, the collections have been the charge of the Piedmont Regional Council.

8°: [i]-xviii, [2], [1]-742 p.

VERY RARE. This work also appears to have been issued under the title: "Catalogue Raisonné de la Collection Minéralogique de l'Université Turin." It is a catalog of the large and important mineralogical collection of the Natural History Museum of Torino [see previous entry note]. The compiler had the duty of overseeing the collection and the responsibility for arranging the cabinet. In the preface he provides a short history of the collections formation. The classification chosen was based on the system of Brongniart.

BOURGEOIS

BOULTER, Daniel. (BORN: ; DIED:) *English merchant.*

Boulter was a merchant in Yarmouth dealing in silverware, jewelry, cutlery, toys, books, coins, medals, antiquities and natural curiosities including minerals. He built a personal collection that was open to the public for the admission price of one shilling. Murray (1904) incorrectly states he was a famous Quaker physician.

MUSEUM BOULTERIANUM, 1793

747. — English, 1794 [Sale catalog].

Museum Boulterianum. | A | Catalogue | Of The | Curious And Valuable Collection | Of | Natural and Artificial Curiosities | In The | Extensive Museum | Of | Daniel Boulter, Yarmouth: | Consisting Of | English and Foreign Birds and Beasts in high Preservation. Reptiles, | Fish and Insects, dried and in Spirit. Elegant Shells, Corals, | Corallines, and other Marine Productions. Seeds, Fruits and | other Parts of rare Plants. Fine Specimens of differnt Ores, | Petrifications, Spars, Fluors, and Crystals. Agates, Calcedonies, | Jaspers, Carnelians, &c. polished and unpolished. Roman, Egyp- | tian, and British Antiquities in Earthen Ware and Bronze. Carvings | in Wood, Stone, Ivory and Alabaster. Curious ancient Enamel- | lings, China and Delft. Shell-Work, Neddle-Work, &c. Cruci-fixes and Rosaries.

Ancient Stained Glass. Pars of Dresses, | Utensils, &c. Ancient Weapons of War. Old Monastic and other Seals. Watches, Rings, and Amulets. Greek, Roman, | Egyptina, British, and English Coins and Medals, in Gold, Silver, | and Copper. Dresses, Ornaments, Weapons of War, Fishing- | Tackle, and other singular Inventions of the Natives of the lately | discovered Islands in the South-Seas. Some capital Paintings by | the first Masters. Rare old Prints, including a large Collection | of Engraved Portraits, with a select Library of curious and | valuable Books in Natural History, Antiquities, &c. &c. Some | curious Missals, and a great Number of other singlar Articles both | Ancient and Modern. | [double rule] | Price One Shilling. | To be had of Henry Gardner, No. 200, Strand; B. & J. White, | Fleet-Street; Darton & Harvey, No. 55, Gracechurch-Street; John | Simcoe, No. 11, Great Queen-Street; London. Yarrington and | Bacon, and R. Beatniffe, Norwich. And other Booksellers in | Town or Country. | N.B. Purchasers to the Amount of Ten Shillings will have the Price | of the Catalogue returned.

4°: A-X4; 84l.; [i]-vi, [1]-159, [1] p. Stiff covers. Printing on the covers reads: [Within an ornate oval border:] Daniel Boulter, | No. 19, Market-Place, Darmouth, | [...16 lines of additional text...]. PAGE SIZE: 204 x 122 mm.

CONTENTS: [i-ii], Title page, verso blank.; iii, "Advertisement."; iv, "Abbreviations Explained."; v-vi, "Index."; [1]-159, Text.; [1] pg], Blank.

VERY RARE. A fixed price sale of the collection of natural and artificial objects accumulated by Boulter. The contents include descriptions of birds, insects, reptiles, shells, minerals, antiquities, "singular inventions of the natives of the lately discovered islands in the south-seas," paintings of the masters, prints, books, and 11 lots of missals on vellum. Quartich in 1972 offered a copy: viii, 165 p. (ca. 1810).

BOURGEOIS, Léon Zéphirin. (BORN: Paris, France, 26 August 1856; DIED:) *French mineralogist.*

Bourgeois was préparator of inorganic natural history for the Collège de France, 1880-3. In 1883, he became préparator of chemistry for the Muséum de Naturelle Histoire. He became professor of chemistry at the Polytechnique Institut in 1890. Bourgeois was among the first to artificially create minerals and igneous rocks.

748. — French, 1881.

Reproduction Artificielle des Minéraux. Paris, Dunod, 1884.

8°: [3], 240 p., 8 plates, illus.

RARE. This basic reference work on the synthesis of minerals, covers the history and methods, with

summaries of a very large number of experiments of minerals arranged by crystallochemical classes. It was published as the first "appendice" of tome 2, "Metalloides", which is part of a larger work *Encyclopédie Chimique* (5 v. in 3), published under the direction of M. Frémy. A short bibliography on the subject appears on pages 227-8.

LETTRES PHILOSOPHIQUES, 1729

PLATES: The single folding engraved plate, 380 x 240 mm., bound in at page 172 shows crystal groups and fossils. It is signed A. De Putter scit.

VERY SCARCE. *Lettres Philosophiques* is an important publication that contributed several noteworthy observations to the sciences of biology and geology. Written as a series of four letters addressed to Johann Jacob Scheuchzer [q.v.], this volume touches upon many subjects of natural history. Included are theories on the formation of stalactites, the chronology of the earth, the generation of minerals and rocks, and the question of reproduction and development in living organisms. An additional tract titled "Memoire sur la theorie de la terre" considers numerous aspects of geological phenomena including the earth's destruction, which incorporates discussions of mechanical weathering, volcanism and earthquakes.

BOURNON, Jacques-Louis, Comte de. (BORN: Metz, France, 21 January 1751; DIED: Versailles, France, 24 August 1825) *French crystallographer & mineralogist.*

Bournon was born into a noble family. He turned his attention to the natural history studies particularly mineralogy. However, he lost his first mineral collection when he fled to England during the French Revolution, but he built a second collection there, which was later sold to the French King Louis XVIII with Bournon becoming the Director. This second collection consisted of 22,881 specimens, nearly half were single crystals. In 1825, the collection was divided between the College de France and the Jardine des Plantes (National Museum of Natural History).

VERY SCARCE. A three volume treatise concerning the properties and relationships of calcite and its structural isomorph, aragonite. To determine the

position de Bournon's work holds in the history of mineralogy, attention must first be focused on the last quarter of the eighteenth century. During this time, a controversy began concerning the relationship between the minerals calcite and aragonite. Although quantitative analysis proved them to be chemically identical, examination of their physical properties showed aragonite to be harder, heavier and to possess a different crystal form. Using these criteria Abraham Gottlob Werner named and classified aragonite as a separate entity from calcite. In 1801, the *Traite de Mineralogie* by Rene Just Haüy also listed aragonite as a separate species, although the French mineralogist admitted more research was needed. This statement produced a flurry of investigations and theories to resolve the aragonite–calcite dilemma.

The present work, de Bournon's most important mineralogical contribution, was written to support Haüy's position that calcite and aragonite were separate mineral species, and that the final determination of whether a mineral is a distinct species relies on physical characteristics, not chemical properties. The seventy-two plates show various crystals of calcite and aragonite. Based on a copy of this work that had loosely laid in the two leaves of the *Traité Complet de la Chaux Carbonatée et de l'Arragonite* the *Traité de Minéralogie* is the first issue.

RARE. Catalog of the large and important
mineral collection created by Bournon. The "Discours
Préliminaire" provides a history of the collection's
formation and observations about the science of
mineralogy. There is also an extensive commentary on
Bournon's relationship with the British Museum and
its trustees. The text contains a detailed description
of the collection's specimens, with information on the
minerals chemical and physical properties. Throughout
Bournon references Haüy and other mineralogists. A
separate section deals with Haüy's theories on crystal
structure.

PLATES: Bound at the end is one folding table, titled, "Table Of The Crystalline Forms Of The Diamond." In addition, there are 4 plates of diamond crystals showing 79 figures.

VERY SCARCE. Translation by Sir Abraham Hume [see note below] of *Catalogue Raisonné des Diamants* (London, 1815). Hume also wrote the short introduction.

Abraham Hume. (BORN: 1749; DIED: 1838) *English gentleman*. Second and last baronet. Hume was elected a member of Parliament from Petersfield, 1774 to 1780. He was elected a Fellow of the Royal Society in 1775, and he was vice-president of the geological society from 1809 to 1813. He was a collector of minerals, precious stones and old masters. Bournon cataloged his minerals, which were acquired by the Sedgewick Museum in Cambridge in 1841.

VERY SCARCE. Translation by Sir Abraham Hume of *Catalogue Raisonné des Diamants* (London, 1815). Hume also wrote the short introduction.

Sinkankas (1994) #830 was to the compiler's research, the first bibliography that has called attention to this new edition. The number of specimens now described is 128 from 107, with the added plate showing various examples between numbers 108 to 128. Eventhough, no indication on the title page, this work should clearly be considered a second edition.

BOWLES, William. (BORN: Cork, Ireland, 1703; DIED: Spain, 1780) *Irish naturalist.*

Bowles studied natural history, chemistry and metallurgy in Paris. In 1752 he was appointed at the recommendation of Don Antonio de Ulloa, superintendent of the Spanish state mines and was also given the task to form a collection of natural history specimens and to fit up a chemical laboratory. To complete these tasks, Bowles travelled extensively throughout Spain, investigating its mines and natural history.

8°: [6], 48, 529, [6] p.

RARE. The author's principal work, this book is of interest to mineralogists for its early descriptions of the mines and geological features of Spain. It is described by *D.N.B.* as "having very considerable value

as being the first work of its kind." It contains large sections on botany, geology, mineralogy and mining, including a long section on the manufacture of saltpeter. In the preparation of the this edition, the author was assisted by Jose Nicolas de Azara y Perera, Marques de Nibbiano, [1730/1-1804], who also edited the second edition (1782).

BOYLE, Robert. (BORN: Lismore, Ireland, 25 January 1627; DIED: London, England, 30 December 1691) *Irish chemist, physician & naturalist*.

Born the son of Richard Boyle, first earl of Cork, Robert entered into a comfortable life with many advantages and much affluence. He was educated by private tutors before entering Eaton at the age of eight. In 1639, he was sent with his next oldest brother to the Continent where he continued his education in the polite arts, language, mathematics and science. The outbreak of the English civil war caused his return to England. His support of the Parliamentarians brought him

BOYLE

into contact with many of the leading English scientists, and through them Boyle developed an interest in chemistry. He entered Oxford in 1656 to advance his studies. After the Restoration, Boyle frequently visited London, finally moving there in 1668. He was one of the founders of the Royal Society of London, and throughout the rest of his life he was one of its most influential and notable Fellows. His home was open to all those interested in science, and in a laboratory he had built onto the house, he performed all his experiments.

AN ESSAY, 1672

770. — English, 1672 [Original edition].

[Contained within a double rule box:] An | Essay
| About The | Origine & Virtues | Of |
Gems. | Wherein are Propos'd and Historical-
| ly Illustrated some Conjectures about the |
Consistence of the Matter of Precious | Stones,
and the Subjects wherein their | chiefest Virtues
reside. | [rule] | By the Honourable Robert Boyle,
Esq; | Fellow of the Royal Society. | [rule] | London,
| Printed by William Godbid, and are to | be Sold
by Moses Pitt at the White | Hart in Little Britain,
1672.

8°: A-M⁸ N⁴; 100ℓ.; [16], 185 p. (i.e., 184, page 181 omitted).

CONTENTS: [2 pgs], Title page, verso blank.; [6 pgs], "The Publisher to the Reader."; [7 pgs], "The Preface."; [1 pg], Blank.; 1-[94], Text, section 1.; 95-185 [i.e., 184], Text, section 2.

VERY SCARCE. **REWORK THIS ENTRY.** VERY SCARCE. A monumental work that can be considered as the first scientific treatise in English on crystallography. Among the many revolutionary insights and theories set forth within this volume are Boyle's belief in the

hydrothermal origin of crystals and crystal growth by accretion of particles around a seed nucleus. Boyle also suspected that the nucleus around which the crystal grows has the same geometry as the final product. Further observations include that the finest crystals grow in open spaces, whereas distorted crystals are only "molds" of the space in which they formed, and that because of a vastly higher specific gravity, rock crystal was not any type of ice. This work also contains observations on the medical virtues of gems.

This celebrated treatise, justly called by Fulton "the beginning of the modern development in knowledge of crystal structure" (Sinkankas). "The literature [on gems] increased at an astonishing rate during the first two centuries after printing; but except for technical works on stonecutting and the setting of precious stones, the subject continued to be largely a mixture of myth and credulity until the advent of Boyle's Essay ... of Gems" (Fulton, p. 67).

The work 'really has very little to do with gemstones except as they happened conveniently to provide crystals for Boyle's inquiries in to the solid state of matter. There are two fundamental hypotheses posed in this essay, the first being "that many of these Gems and Medical Stones, either fluid bodies, as the Transparent ones; or in part made up of such substances as were once fluid," and second "that many of the real Virtues of such stones may be probably derived from the mixture of Metalline and other Mineral substances, which, (though unsuspectedly,) are usually incorporated with them." However, an even more fundamental concept underlies both hypotheses which Boyle clearly demonstrates that he was aware of even though he does not say so explicitly, that is, that crystals grow from solution from very minute particles which attach themselves to the growing crystal in such a manner that they add bulk and create characteristic external planes ...' (Sinkankas).

VERY SCARCE. Translation by [H.O. ??] of *An Essay about the Origine & Virtues of Gems* (London, 1672).

Henry Oldenburg. (BORN: Bremen, Gernay, c1618; DIED: Charlton, near Greenwich, England, 5 September 1677) *English scientist*. Oldenburg graduated from the University of Utrecht in 1641, and he matriculated at Oxford from 1657 to 1658. He taught in the Paedagogium of Bremen. Later he became a professor in the newly established University of Dorpat, in what is now Estonia. Although it is known that Oldenburg matriculated in the University of Utrecht in 1641, nothing is known with assurance about what he did during the following twelve years, but there is presumptive evidence that he was a tutor during these years. In 1656 he became tutor to Boyle's nephew, Richard Jones, later the third Viscount Ranelagh and first Earl of Ranelagh. Oldenburg made a profession of scientific administration. He founded a system of records in the Royal Society that is still followed, created an international correspondence of scientists, and founded the first scientific journal, *The Philosophical Transactions of the Royal Society of London*. Oldenburg began publishing in 1665 the *Philosophical Transactions*, which were his personal enterprise, to make money, although he never made as much as he hoped. He also translated papers for the *London Gazette*. He also translated and published works from abroad. He translated at least two of Boyle's works into Latin, and he appears to have functioned effectively as the publisher for a number of Boyle's works.

BRAGG, William Henry. (BORN: Wigton, Cumberland, England, 2 July 1862; DIED: London, England, 12 March 1942) *English physicist & crystallographer.*

Bragg was professor of physics successively at the University of Adelaide, South Australia (1886-1908), University of Leeds (1909-1915) and the University College of London (1915-1920). In 1923, he became director of the Royal Institution. In association with his son, William Lawrence, he developed an ionization spectrometer, which

W.H. BRAGG

he successfully applied to the X-ray study of crystals, and is today known as an important pioneer in the field.

X rays and crystal structure by W.H. Bragg and W.L. Bragg. London : G. Bell and Sons, 1915.

8°: vii, 228 p., 4 plates, diagrams.

VERY SCARCE. Bragg began his studies on crystal structure in 1912 and developed new methods for measuring the wavelengths of X-rays. The 'Bragg relation' opened up the use of X-rays in the study of solid bodies, particularly crystals. Through the use of the spectrometer which was built to measure the wavelengths, distances between atoms within a crystal lattice could be calculated by determining the refraction of a known wavelength of X-ray on to film surrounding target. This was a pivotal milestone in crystallographic determination. Before 1913, only general symmetry relationships could be pronounced about crystals, but by the end of 1913, the Braggs had reduced crystal structure analysis to a technical procedure. For these researches the father and son team received the Nobel Prize for physics in 1915. Their *X-rays and Crystal Structure* is the first separate publication collecting together material surrounding this remarkable research.

Earlier article, 1913: The Reflection of X-Rays By Crystals by W.H. Bragg and W. L. Bragg, published in: *Proceedings of the Royal Society, London*, 88 (1913), pp. 428-

BRANDT

438.

This is the first serialization describing the 'Bragg relation,' and which lead the Bragg's to construct the first X-ray spectrometer.

Concerning | The Nature Of Things | Six Lectures delivered | at the Royal Institution | By | Sir William Bragg | K.B.E., D.Sc., F.R.S. | Director Of The Royal Institution | [ornament] | London | G. Bell And Sons, Ltd. | 1925.

8°: xi, 231, [1] p., 32 plates, illus.

VERY SCARCE. Professor Bragg's Christmas Lectures for children given at the Royal Institution were famous. One series was issued in book form under the title, *Concerning the Nature of Things* (London, 1925). Here, Bragg shows his genius in explaining in simple terms the complex nature of solids, liquids and gases that envelop us. Using layman language, he describes and defines atoms, gases, liquids, crystals, ice and snow crystals and metal crystals, all in a very readable volume. As an accurate introductory text it was at its publication a great source for readers wanting to know the internal structure of everything, and today it can still be examined to gain valuable insights into the nature of matter.

Reprinted: The book was reprinted in 1927, 1931, and 1933 with apparently little change to the text.

BRANDT, Georg. (BORN: Riddarhytta, Westmanland, Sweden, 26 June 1694; DIED: Stockholm, Sweden, 29 April 1768) *Swedish chemist*.

Brandt was educated under Boerhaave in Leiden, The Netherlands, receiving his M.D. in 1726. In 1727, he became director of the chemistry laboratory of the Swedish Bureau of Mines. Appointed the warden of the Stockholm mint in 1730, Brandt was later appointed professor of chemistry at the University of Uppsala. He was the first to produce accurate researches on arsenic and to discover zinc in calamine (now smithsonite). He distinguished between potash and soda in 1746.

[wavy rule] | På Kongl. Ventenskaps Academiens befallning. | [ornate rule] | Stockholm, | Tryckt hos Directeuren Lars Salvius, 1760.

8°: A⁸ B⁴; 12l. [1]-24 p. Title-vignette, head-and tailpiece, initial.

CONTENTS: [1-2], Title page, verso blank.; [3]-22, Text.; 23-24, "Svar, | Gifvet på | ... | Min Herre!"

RARE. By roasting what at the time was called Swedish pyrite (mineral: linnaeite), Brandt obtained a black powder, which he further reduced with charcoal powder and fluxes in the intense heat of a forge with bellows. The result was a compact mass with a reddish tint that was magnetic, malleable and of high melting point. This is the first separate publication announcing Brandt's discovery of the element cobalt, describing the process of reducing the metal.

BRANT, Sebastian. (BORN: Strassburg, Germany, 1458; DIED: Strassburg, Germany, 10 May 1521) *German humanist & satirist.*

Brant studied at Basel and took the degree of doctor of laws in 1489. He was a longtime professor of jurisprudence there. He retired to Strassburg, where he was made syndic of the town. Today, he is remembered for his famous satire, *Das Narrenschiff* [English: *Ship of Fools*] (1494), which describes a ship laden with fools and steered by fools to the fools' paradise of Narragenia.

Von dem donnerstein gefallē im xcij. iar: vor Ensisheim.

Folio broadside. At the head is a woodcut showing the impact of the meteorite.

EDITIO PRINCEPS. Very rare. Provides an account of the meteorite ("thunder-stone") which fell near Ensisheim, Upper Alsace, France, on November 16, 1492 at 11:30 P.M. It is the earliest meteorite the fall of which was seen and recorded, and the substance of which was preserved. The Emperor Maximilian, arriving at Ensisheim shortly after the fall, presented a fragment to the Archduke Sigismund, retained another for himself, and deposited the remainder in the parish church. This 260 pound fragment remained in the choir of the parish church for centuries until during the French Revolution the stone was taken and placed in the public library of Colmar. Subsequently, fragments were broken off and presented to various persons and institutions. Fourcroy obtained a piece of 9.5 kilograms for the Musée d'Histoire Naturelle in Paris. The remainder weighing about 40 kilograms was afterwards returned to Ensisheim.

BRARD, Cyprien Prosper.

(BORN: L'Aigle, Dép. Orne, France, 21 November 1786; DIED: Lardin, France, 28 November 1838) *French mineralogist.*

Brard studied mineralogy under Bronignart, and while still a student published his *Manuel du Minéralogiste et du Géologue Voyageur* (Paris, 1805) for his friends. He made an extensive tour by foot of the Alps in Switzerland and Central Europe, and in 1808 he became an aide to Faujas. Brard was appointed director of the copper mines of Servoz in 1813 where he was the first to use anthracite coal as a fuel. In 1816, he entered into a franchise that created a glassware factory in Lardin. The glass produced became well known as the Brardville pattern. In 1828, for some unknown reason, Brard abandoned this pursuit. He retired to Lardin in 1832.

BRAUNS, Reinhard Anton. (BORN: Eiterfeld near Kassel, Germany, 20 August 1861; DIED: Bonn, Germany, 28 January 1937) *German mineralogist, petrologist & gemologist*.

Brauns attended the University of Marburg from 1881 to 1885, receiving his Ph.D in 1884. From 1883 to 1894 he was an assistant at the Mineralogical Institute in Marburg. In 1894, Brauns was appointed ordinary professor of mineralogy and geology at the technical high school in Karlsruhe, but in 1895 he took a similar post at the University of Giessen. In 1904 Brauns moved on to the University at Kiel, Germany, and in 1907 to the University of Bonn where he spent the remainder of his life. Brauns was a founding member of the Deutsche Mineralogische Gesellschaft, as well as an honorary member of many other societies. He was an editor of the *Neues Jahrbuch für Mineralogie und Geologie* and the *Zeitblatt für Mineralogie*. His major theoretical work centers upon the optical anomalies in crystals, chemical mineralogy and the production of synthetic gemstones.

VERY SCARCE. A prize winning essay extending the pioneer work of Mallard on optical anomalies. It is a compendium of all known facts about optical crystal anomalies. Divided into two major parts, the first of which develops the subject through an historical review recalling the work of Mallard, Brewster, Biot, Scacchi, Neumann, among others (pp. 5-56). The second part describes optical anomalies Brauns had observed in a large variety of minerals (pp. 57-362).

DAS MINERALREICH, 1903

REFERENCES: BL. • NUC.

805. — German, 1903 [First edition, issue A].

Das | Mineralreich | von | Dr. Reinhard Brauns,
| ordentl. Professor an der Universität Gießen.
| [ornate rule] | Mit vielen Text-Illustrationen
| 73 Farbentafeln, 14 Lichtdrucktafeln und 4
Kunstdrucktafeln. | [Ornament incorporating the
initials F L V] | Eßlingen und München | Verlag
von J.F. Schreiber | 1903.

4°: [2], 4, [3], 6-440, [8] p., 93 plates (73 colored), 275 figs (photos, line drawings). PAGE SIZE: 300 x 225 mm.

VERY SCARCE. A classic work in popular mineralogical literature. Braun's *Das Mineralreich* is a large format, ambitious book sought after today for its c900 color illustrations that show the most important minerals in their natural form, color, and size on 73 chromolithographic and 14 black and white plates. But when Brauns wrote the book, he was at the pinnacle of his profession, and the text reflects his deep love and technical knowledge of minerals, which surprisingly can still be read with interest, especially for the details on old European localities. However, the text is now largely overlooked and thought to be obsolete due to the incorporation in the book of the chromolithographic plates.

These plates were at their publication a sensation for their quality. It required much planning and great

BRAUNS

technical and artistic ability to produce the illustrations that were modeled on actual specimens. So that no damage would occur from transport, minerals from various private and publish European collections were carefully packed and hand delivered to the Schreiber's studios in Stuttgart. Gustav Seligmann [1849-1920] whose collection was renowned for the aesthetic quality of its specimens was a strong supporter of the project with 132 of the depicted pieces being from his collection. Seligmann's collection was later incorporated into the Carl Bosch [1874-1940] collection, which was ultimately purchased in 1966 by the U.S. National Museum (Smithsonian Institution) in Washington. Today, the Seligmann specimens that are identifiable from the plates are especially noted within the collection. Good quality specimens were essential because the plates were intended to be easily recognizable to collectors. Medenbach notes that comparison between the actual specimens with the plates show that the manual work was implemented with much love and care, although some details were not included. Even without the lack of detail, the objective of depiction was met with species easily distinguished. Unfortunately, Braun's *Mineralreich* was among the last mineralogical works to be illustrated by the chromolithographic process. Technical advances in color photography and printing would soon supplant the labor intensive lithographic process.

This first edition was originally issued in 30 parts or "Lieferungen," presumably to allow the publisher to begin recovering costs for a very expensive production, and allow the buyers to acquire an expensive volume through a subscription spread over months. At the conclusion of publication, the 30 parts could then be bound into a single volume. That it was a successful venture is displayed by the appearance of other German editions, and translations sponsored by the publisher utilizing the same plates into English, Italian, Czech and Russian.

806. First edition, issue B, 1912: Das | Mineralreich | von | Dr. Reinhard Brauns | ordentl. Professor an der Universität Bonn | [ornate rule] | Mit vielen Text-Illustrationen | 73 Farbentafeln, 14 Lichtdrucktafeln und 4 Kunstdrucktafeln. | Unveränderter Neudruck | Eßlingen und München | Verlag von J.F. Schreiber | 1912.

4°: [4], 440, [6] p., frontispiece, 91 plates (73 chromolithographic).

VERY SCARCE. After the original 30 Lieferungen were issued, the publisher reissued the book. However, to make a cheaper edition, they made the unfortunate decision to use steel staples to bind the sections. Over time, these sections will become loose and even come apart. In addition, a cheaper grade of paper seems to have been used for printing the text.

BRAVAIS, Auguste. (BORN: Annonay, France, 23 August 1811; DIED: Le Chesnay, France, 30 March 1863) *French crystallographer, botanist, astronomer & physicist.*

Bravais received a classical education at the *Collège Stanislas* in Paris, graduating in 1827. In 1829, he won first prize in mathematics in a general competition and was accepted to the *École Polytechnique*. He was first in his class at the end of the first year which made him eligible to select any technical field except mining. Since his passion from youth was to explore the world, he chose to enter the French navy. In 1832, Bravais shipped out. He sailed the Mediterranean and in April of that year was assigned to map the coast of Algeria. The first of many expeditions he would accompany. Several important publications on plant organography won him membership in the *Société Philomathique de Paris* in 1835. On an extended assignment in Norwegian Lapland from 1838 to 1839, Bravais made numerous observations in astronomy, meteorology and terrestrial magnetism. Several years later in 1845, he accepted an appointment as professor of physics at the *École Polytechnique*. There, he became interested in symmetry and reticular groupings, sending several important papers to the *Académie des Sciences*. Among these were several important in the development of crystallography [which see below]. Bravais held membership in the *Académie Royale des Sciences, Belles Lettres et Arts de Lyons* and the *Académie des Sciences*.

PLATES: Consist of reproductions from Bravais' various papers concerning crystallography. Consequently, the subjects deal with crystal drawings and diagrams.

RARE. A collected works of Bravais as it relates to crystallography to stand as his memorial to the science he contributed so much to. According to the advertisement, it was pulled together by ?? H. de Senarmont [????], and probably published by the Académie des Sciences in Paris. The preliminaries include a portion of Élie de Beaumont's eulogie to Bravais and a review of the importance of his contributions to crystallography. The text then reprints

several monographs that appeared decades before but that had a profound influence on crystallography in morphological and structural studies. At the conclusion of the volume are two papers by M. Cauchy [????] describing the importance of the previous reprints in crystallography.

"Beginning in 1848, Auguste Bravais wrote a series of papers in which he treated initially the types of geometric figures formed by points distributed regularly in space and then applied these considerations to crystals, with the points viewed as being the centers of gravity of the chemical molecules or as poles of forces. With this approach, Bravais was able to explain the cleavage and external symmetry of crystals as a function of the reticular density. Most important, Bravais demonstrated that there was a maximum of fourteen space lattices or groups of points differing by symmetry and geometry whose translational repetition in space maintained the symmetrical arrangements of the points of a unit cell. He perceived that these fourteen space lattices denoted seven different lattice symmetries which corresponded to the previously recognized seven crystal systems. Hence, the external symmetry became firmly grounded on the concept of the space lattice." (Burke).

German, 1890: A. Bravais' Abhandlungen über symmetrische polyeder. (1849) Uebersetzte und in gemeinschaft mit P. Groth herausgegeben von C. und E. Blasius. Mit 1 tafel. Leipzig, W. Engelmann, 1890. 50 p., diagrams on folding plate.

Published as *Ostwald's Klassiker der exakten Wissenschaften*, no. 17, this translation was edited by Eugen Heinrich August Blasius [1861-] and Paul Groth. It was first published under titles "Note sur les polyèdres symétriques de la géométrie" and Mémoire sur les polyèdres de forme symétrique" in the *Journal de mathématiques pures et appliquées*, par Liouville, 1849.

German, 1897: Abhandlung über die systeme von regelmässig auf einer ebene oder raum vertheilten punkten, von A. Bravais ... (1848) Uebersetzen und herausgegeben von C. und E. Blasius. Mit 2 tafeln. Leipzig, W. Engelmann, 1897. 142 p., 42 diagrams on 2 folding plates.

Published as *Ostwalds Klassiker der exakten Wissenschaften*, no. 90, first published in *Journal de l'École polytechnique*, tome 19. It formed part 2 of *Études Cristallographiques*, published in 1866. The present translation is based upon the 1866 edition.

English, 1949: On the systems formed by points regularly distributed on a plane or in space; translated by Amos J. Shaler. Crystallographic Society of America, 1949. viii, 113 p., diagrams.

Published as *The Crystallographic Society of America. Memoir*, no. 1. It is a translation of the original paper that first appeared as "Mémoire sur les systèmes formés par des points distribués régulièrement sur un plan ou dans l'espace" in *Journal de l'École polytechnique*, cahier 33, tome XIX, pages 1-128, Paris, 1850.

Saggio | Di Osservazioni Mineralogiche | Sulla | Tolfa, Oriolo, E Latera | Di | Scipione Breislak | Delle Scuole Pie | Lettore Di Filosofia Nel Collegio Nazareno | Dedicato | A Sua Eccellenza Reverendissima | Monsignor | Onorato Gaetani | De' Duchi Di Sermoneta. | [ornament] | In Roma MDCCCLXXXVI. | Nella Stamperia Di Giovanni Zemple. | Con licenza de' Superiori.

8°: xvi, 110 p., ornament on title page, a few decorative initials.

RARE. This is a descriptive account of the natural resources of the West central region of Italy, and the mining areas of Tolfa, Oriolo-Romano, Civitavecchia, and Latera. After his appointment as a professor at the Collegio Nazareno, Breislak spent his leisure time in geological researches in the papal states. His account of the aluminous district of Tolfa and adjacent hills, published in 1786 as *Saggio di Osservazioni Mineralogiche sulla Tolfa* gained for him the notice of the King of Naples. He was invited by the King to inspect the mines and related works in that kingdom,

SAGGIO, 1786

TOPOGRAFIA, 1798

which led to his appointment as professor of mineralogy to the royal artillery.

Essais Mineralogiques sur la Solfatare de Pouzzole par Scipion Breislak ... Traduit de Manuscrit Italien par Francois de Pommereul ... Naples, Chez Janvier Giacco, 1792.

8°: 240, [2] p.

VERY SCARCE. Translation by Baron de François René Jean Pommereul [which see note] from an otherwise (?) unpublished manuscript. In the volcanically active district of Solfatara near Naples, mining and extraction of alum had probably occurred since ancient times. However, it was under Breislak's direction as inspector of mines for the Kingdom of Naples that a vast works for the mining and refining of sulphur was established. Sulphur being an important component of gun powder became an important economic factor in the Naples economy of the nineteenth century. In this *Essai*, Breislak describes the minerals of the area.

François René Jean Pommereul. (BORN: 1745; DIED: 1823) *French aristocrat & military officer.* General in Napoleon Bonaparte's campaigns of 1796-7.

RARE. The fossiliferous zone of Pietraroia has in the past been the subject of important scientific studies executed by foreign as well as Italian experts. The first researcher to become interested in the zone was the geologist Scipion Breislak. In his work entitled *Topografia fisica della Campania*, he cited for the first time the Pietraroia fish: "Above Cerretto rises the high mountain of Pietraroia, which is one of the peaks of Matese, very interesting for the materials it yields. This mountain in some parts of is composed of calcareous scissile rock with fish imprints. The hardness of the shale, however, and the multiplicity of the crystalline veins intersecting in all directions, are such that only with difficulty it is possible to have beautiful specimens. They are never of that beauty and precision that one observes in the fish fossils of Bolca."

2 vols. [VOL 1] 8°: [4], xvi, 300 p., one plate, 2 maps. [VOL 2] 8°: [4], 323, [1] p., one plate, 2 maps.

SCARCE. Translated by Baron de François René Jean Pommereuil [which see note] of *Topografia Fisica della Campania* (Firenze, 1798). This first edition if French acts like a second edition to the original work, having been enlarged and corrected by Breislak for the translator. Beyond that, Pommereuil has added useful and insightful notes to the original text, as well as several maps of the region.

The first great table is on strong paper and represents the region around to Naples; the others show the Vesuvio, the physical plant of the outskirts of Rome, the extinct craters of the vesuviana zone, the design of a machine realized from the author in the crater of a Solfatara and the crystallization of blocks of branch caused from the action of washes during the eruption of 1794. "In the 1794 Breislak witnessed the eruption of Vesuvius and made direct observations at the Fields Flegrei and Pozzuoli sulfur mines. Physical topography of the Campania, which discusses his studies on volcanoes, includes his opinion that the volcanic systems of Latium and Campania to were connected at the ancient volcano Roccamonfina, eruptive whose apparatus and washes he had discovered. Considered one of founders of vulcanology in Italy, Breislak was the first to determine that basaltic rocks to were of extrusive origin. He concluded that for to long Time Monte Sum, the second summit of Vesuvius, had been active until A.D. 79; that it had been eroded; and that the cone of Vesuvius had been set upon it within historical Time" (DSB, II, p. 439). "In 1801, Scipio Breislak published to descriptive and geological work on the Phlegraean fields, the extinct volcanoes near Rocca Monfina, on Mount Sum, Vesuvius, the Baiae, Procida and Ischia. This work comprises several maps, and is in many respects supplementary to Spallanzani's Travels. Breislak also contributed the first researches on the geology and stratigraphy of Rome, and of that part of the Apennines which surrounds the volcanic area of the Italian mainland" (K.A. von Zittel, History of Geology and Palaeontology, London, 1901, pp. 78-79). With wide final index of the matters. The Breislak, been born to Rome from Swedish, chierico father regular, was premature much in the studies, becoming teaching already in young age. In 1781 it was called to the college of Urbino, therefore it passed after some years to Rome to the Nazareno college, where it organized an important mineralogico cabinet. From 1787 it taught to Nola before, then to Naples. In 1798 it made return Rome, where it had important part in the formation of the republican government, of which minister of finances was name. Fallen the Republic Roman, one joined to the directed French troops to Marseilles. To Paris it had way to know the greatest French scientists of the age, between which Chaptal, Fourcroy and Cuvier. In 1802 it re-entered in Italy. In the '05 member of the Italian Real Institute was name and was already member of the Real Societies of London, Edinburgo, Berlin and Torino. In 1815 it founded, with to the Giordani and Mounts, the Italian Library. In the within of the controversy, that it then cracked the world of the geologic studies between the A.G. supporters Werner and those of J. Hutton, the position of the Breislak was much critic in the first comparisons of and far from the excesses of second (cfr. DBI, XIV, pp. 118-120).

[Vol 2] [1-2], Title page, verso blank.; [3]-453, Text.; [454], "Indice De Capitoli." (=table of contents); [455]-490, "Indice" (=general index).

RARE. Celebrated first appearance of this important and influential geological textbook that according to Zittel contained Breislak's "able criticism of the Neptunian dogmas was largely instrumental in eradicating them from the teaching of the universities and colleges... Breislak gives a good account of volcanic phenomena and volcanic rocks in Italy, and contributes a number of valuable observations on gaseous explosions, volcanic ejecta, and on lava and basalt." It was translated into French and German shortly after publication. Breislak is considered one of the founders of volcanology in Italy. He was a critic both of the theories of Plutonism and of Neptunism.

BREITHAUP, Johann August Friedrich. (BORN: Probstzella, Germany, 16 May 1791; DIED: Freiberg, Germany, 22 September 1873) *German mineralogist*.

Breithaupt studied mathematics and science at the University of Jena. He found an interest in geology, and subsequently matriculated at the Freiberg Bergakademie,

BREITHAUPT

where he received his instruction from A.G. WERNER. He was granted an honorary doctorate by the Universities of Jena and Marburg. Subsequently, he was appointed Inspector of the Academy collections and also adjunct professor of mineralogy and geology at Freiberg, 1813–26. He became full professor in 1826, a position he retained for 40 years. He held membership in many European scientific academies. Throughout his career Breithaupt independently discovered 47 mineral species, made over 3,000 measurements of calcite, studied amorphous crystal structures, developed the law of paragenesis in minerals, and contributed to reforming mineralogical nomenclature. In recognition of his mineralogical skills, an antimonickel mineral was named “Breithaupt” in his honor by ??, 18??.

UIBER DIE AECHTHEIT DER KRYSTALLE, 1815

[57]–63, “Zweite Beilage.”; [1 pg], Blank.

VERY SCARCE. The first monograph devoted exclusively to those strange mineral formations Werner had termed “Afterkrystalle,” and what are now called mineral pseudomorphs. The publication of *Ueber die Aechtheit der Krystalle* marked the beginning of Breithaupt’s most important study, and the research he is best remembered for today, paragenesis.

DIE PARAGENESIS DER MINERALIEN, 1849

837. — German, 1849.

Die | Paragenesis der Mineralien. | [rule] | Mineral-
ogisch, geognostisch und chemisch beleuchtet, | mit
besonderer Rücksicht auf Bergbau. | [rule] | Von |
August Breithaupt. | Mit einer Holzschnitt-Tafel.
| [ornate rule] | Freiberg, | Verlag von J.G. Engel-
hardt. | [rule] | 1849.

8°: π⁵ 1-178 182; 138ℓ.; [10], [1]-276 p., one folding
woodcut plate. PAGE SIZE: 217 x 132 mm.

CONTENTS: [2 pgs], Title page, verso blank.; [1 pg],
Dedication to King Friedrich August of Saxony.; [1 pg],
Blank.; [2 pgs], "Vorrede."—signed August Breithaupt,
March 1849.; [2 pgs], "Inhalt."; [2 pgs], "Verbesserungen."
[1]-7, "Einleitung."; [8]-276, Text.; [At end], One folding
plate, showing 14 figures.

VERY SCARCE. In *Die Paragenesis der Mineralien*,
Breithaupt published the first comprehensive study
of associations and age relationships among minerals.

BREMBATI

Although other mineralogists such as the Russian Severgin had occasionally observed some regularity in associations among different minerals, Breithaupt was the first to actively conduct research in this area as a separate study. He was well situated for this purpose with the extensive mineral collection of the Bergakademie readily available and the mining activity along the Erzgebirge in full blossom. He collected together his observations about mineral relationships in the *Paragenesis*; the importance of which was immediately recognized by others studying mineralogy, petrology and geochemistry. For instance, Gustav Bischoff frequently cites the *Paragenesis* in the first volume of his *Textbook of Chemical and Physical Geology* (4 vols., London, 1857-??), and the study of mineralogical and geological relationships is today still described by the term "parageneses." Oddly, Breithaupt apparently failed to recognize his *Paragenesis* as an important contribution. In summarizing his views and accomplishments at the end of his career for inclusion in the *Festschrift* published to commemorate the centennial of the Bergakademie (1866), Breithaupt does not even mention the paragenesis of minerals.

REFERENCES: BMC: 2, 229. • DSB: 2, 440-41 [by A. Pabst]. • *Festschrift zum hundertjährigen Jubiläum der Königl. Sächs. Bergakademie zu Freiberg am 30. Juli 1866*. Dresden, 1866. • Roller & Goodman, *Catalogue*, 1976: 1, 163.

838. — German, 1852 [First edition].

Die Charaktere der Klassen und Ordnungen des Mineral-Systems ... Freiberg, Gerlach'sen Buchdruckerei, 1852.

8°: 22 p. VERY RARE.

839. 2nd edition, 1855: Die | Charaktere | der | Klassen und Ordnungen | des | Mineral-Systems | von | August Breithaupt. | [ornate rule] | Als Manuscript ausgegeben. | Zweite Ausgabe. | [tapered rule] | Freiberg. | Bei Craz und Gerlach. | 1855.

8°: π^{12} ; 12 ℓ .; [1]-22, [2] p. In printed wraps, with the title page being the front cover. PAGE SIZE: 226 x 142 mm. uncut.

CONTENTS: [1-2], Title page, verso blank.; [3], "Vorbemerkungen."; [4], Blank.; [5]-22, Text.; [1 pg], Blank.; [1 pg], Back cover, colophon, "Druck der Gerlach's Buchdruckerei."

VERY SCARCE. This work sets out a synopsis to Breithaupt's mineralogical classification as presented in his *Handbuch der Mineralogie* (3 vols., Dresden & Leipzig, 1836-47). It provides an overview of the classes and groups of mineral species and indicates some of their physical properties such as color, luster, hardness, specific gravity, streak, etc.

VERY SCARCE. This is a comprehensive treatment of mineralogy, directed towards collectors of minerals. Part 1 covers the morphology of crystals and the physical and chemical properties of minerals. A section at the end concerns the philosophy and purpose of collecting minerals. Part 2 is a comprehensive descriptive mineralogy with standard information augmented from the vantage point of a collector's interest. The second part concludes with a list of references and indexes to the minerals described and localities cited. The text is illustrated throughout by over three hundred illustrations prepared by the author for this work.

846. — German, 1884.

Methodik | Der | Krystall-Bestimmung. | [ornate rule] | Von | Dr. Aristides Brezina | Custos am k.k. mineralogischen Hof-Cabinete, Privatdocent an der Universität Wien. | [ornate rule] | Mit einer lithogr. Tafel und 93 in den Text gedruckten Holzschnitten. | [ornate rule] | Wien. | Druck und Verlag von Carl Gerold's Sohn. | 1884.

8°: 342 p., one lithographic plate (folding), 93 woodcuts.

VERY SCARCE. In this work, a prize winning essay, Brezina investigates crystals, concentrating on the various methods used to measure their forms. He attempts to determine the best method that requires the shortest time to make the measurements of the crystal form and create its stereographical projection. Methods of optical determination are also discussed including orientation, optical axes, parallel plates, etc. Brezina also includes information on various theories together with his own critique of them regarding the material he covers.

PESANTEUR SPÉCIFIQUE DES CORPS, 1787

847. — French, 1787.

Pesanteur Spécifique Des Corps. Ouvrage utile à l'Histoire Naturelle, à la Physique, aux Arts & au Commerce. Par M. Brisson, de l'Académie Royale des Sciences, [...3 lines of titles and memberships...] [ornament] A Paris, De L'Imprimerie Royale. [double rule] M. DCCLXXXVII.

4°: π^1 a-c⁴ A-Nnn⁴ Ooo²; 251 ℓ .; [2], j-xxiv, [1]-453, [1], j-xx, [2] p., 2 plates, engraved title. PAGE SIZE: 260 x 184 mm.

CONTENTS: [2 pgs], Title page, verso blank.; j-xix, "Discours Préliminaire."; xx-xxij, "Tableau Méthodique Du Règne Minéral."; xxij-xxiv, "Table Méthodique Des Fluides."; [1]-453, Text.; [1], Blank.; j-xx, "Table Des Matières."; [2 pgs], "Additions Et Corrections."

VERY SCARCE. Brisson, an experimental physicist of great skill, prepared this work, considered "The first major tables of specific gravity." Inaccuracies in previous compilations of specific gravities, including

the widely used and extensive tables of P. Van Musschenbroek [1692-1761], led Brisson to determine the specific gravity values of a large number of metal, mineral, fluid, animal, and vegetable substances, using clean water at a standard temperature. As Sinkankas notes, Brisson was accurate enough to be able to distinguish between authentic and fake precious stones through the means of specific gravity. Brisson urged that this method of identification together with other commonly used features like color and hardness could be a reliable diagnostic tool. Through his role as a teacher and his writings, Brisson had considerable influence in spreading scientific knowledge.

GLOSSARY OF MINERALOGY, 1861

852. — English, 1861.

A | Glossary of Mineralogy. | By | Henry William Bristow, F.G.S. | of the Geological Survey of Great Britain. | [ornament] | London: | Longman, Green, Longman, and Roberts. | 1861.

8°: A⁸ a-b⁸ B-Z⁸ Aa-Dd⁸ Ee² 2A-2C⁴ 2D² χ²; 235ℓ.; [i]-xlvi, [1], [1]-420, [2] p. Printer's device on page 420. PAGE SIZE: 192 x 125 mm.

CONTENTS: [i-ii], Half title page, "Glossary of Mineralogy," verso "London Printed by Spottiswoode and Co.," [iii-iv], Title page, verso blank.; [v]-vi, "Preface"—signed Henry W. Bristow, 1st September 1861.; vii, "The

following is a list of the principal books which have been referred to in compiling this work." [27 entries]; [viii], blank.; [ix], "Table of Contents."; [x], Blank.; [xi]-xxviii, "Introduction."; xxix-xliii, "Classification of Minerals."; xlv-xlv, "List of Symbols and Signs made use of in the following work."; xlv, "Technical Terms used by Jewellers and Lapidaries."; xlvii, "Errata and Addenda."; [1 page], Blank.; [1]-420, "A Glossary of Mineralogy."; [1 pg], Title page advertisement for J. Beete Juke's 'The Student's Manual of Geology.'; [1 pg], Blank.

SCARCE. In the preface, Bristow writes of his wish to create a work that could be used by those wishing to study the mineral collections of the British Museum and the Museum of Practical Geology. A short technical introduction briefly defines crystallography, physical and chemical properties, mineral classification, and the floor plan of the Museum of Practical Geology of London. The main text is an alphabetical dictionary of hundreds of terms. Many of the definitions are more detailed than a simple explanation by providing historical and locality information.

VERY SCARCE. This is an author catalog, covering the general library and the libraries attached to the Departments of Zoology, Geology, Mineralogy and Botany. It is particularly valuable for the detailed bibliographical notes and tables of contents of composite works, series, reports of scientific expeditions, etc. The original catalog consists of the first five volumes that were in later years supplemented by three additional volumes. From its publication it has been an important reference, listing titles of many rare books in natural history, including mineralogy.

Facsimile reprint, 1992: New York, Maurizio Martino, 1992. 8 vols. bound in four.

BROCCHI, Giovanni Battista. (BORN: Bassano, Italy, 18 February 1772; DIED: Kartoum, Sudan, 23 September 1826) *Italian geologist & mineralogist.*

In 1801, Brocchi was named professor of natural history at the Lyceum in Brescia. In 1809, he became inspector of mines in Milan, and for this made an extensive tour of Italy. At the request of the royal family, he made in 1821 an tour of Egypt. Brocchi was a member of the Institute of Milan.

It studied jurisprudence and theology to the University of Padova, but very soon it began to be interested to natural sciences and in particular to geology. He was university professor of natural history to the Grammar school of Brescia from 1801 to 1808, year in which was called in the napoleonic administration of the Reign of Italy like Inspector of the mines and it was moved to Milan. Brocchi maintained this assignment until the dissolution of the Council of the Mines in 1814 and published three deals to you mineralogici on some goes them Lombardic and tirolesi south. Between 1811 and 1819 compi you attend geo-mineralogici travels in several regions of Italy being interested in particular to vulcanici lands of Lazio and Campania. It died during a travel in Africa.

VERY SCARCE. An extensive work on the iron works of Mella in Val Trompia near Brescia. It contains an historical section, an exposition of the methods of excavation, the fusion of the minerals and their treatment, followed by the descriptions of the different varieties of iron and their chemical analyses. The last section deals with the geology of the region. The author was a pupil of Werner.

[Vol 2]

VERY SCARCE. A beautifully illustrated monograph being one of the fundamental works on the Tertiary paleontology and stratigraphy of Italy. After a long introduction the work continues with a summary of the progress of paleontological science in Italy from 1300 to 1810. This is followed by an account of the formation of the Apennines Mountains and the adjacent plains, in which the Mesozoic and Tertiary sediments are clearly distinguished and described. The second volume provides descriptions of shells from the Tertiary Epoch of the whole country, which is illustrated by sixteen masterfully engraved plates. Of special interest are Brocchi's ideas on the extinction and the duration of existence of genera and species; he rejects the supposition of great catastrophes, and inclines to the theory of a steady and regular development.

BROCHANT

BROCHANT DE VILLIERS, André Jean Marie.

(BORN: Villiers, near Mantes, France, 6 August 1772; DIED: Paris, France, 16 May 1840) *French geologist & mineralogist.*

From 1791 to '93, Brochant studied under A.G. WERNER at Freiberg. In 1794 he entered the newly formed École des Mines. He won an appointment as an engineer in the Agence des Mines in 1800 and became an editor of the *Journal des Mines* in 1801. In 1804, Brochant was named a professor of geology of mineralogy at the École des Mines. Eventually he became inspector general of mines throughout France. Brochant was instrumental in establishing a national survey to produce a geological map of the country. He held membership in the Académie des Sciences. In his honor, the mineral species "Brochantite" was named in his honor by A. LÉVY in 1824.

[Vol 2] [i-ii], Half title page, "Traité | Élémentaire | De Minéralogie. | Tome II.," verso "Avis Au Relieur.;" [iii-iv], Title page, verso blank.; [v]-vii, "Avertissement.;" [1 pg], Blank.; [1]-488, Text.; [489]-557, "Appendice.;" [558], Blank.; [559]-640, "Traité Des Roches.;" [641]-658, "Table | Des Noms Français.;" [659]-670, "Table | De Noms Allemands.;" [671]-674, "Corrections Et Additions."

VERY SCARCE. A major exposition of Werner's theories in the French language. Brochant writes that he originally conceived to write a work that provided a concise view of the mineralogical principles of Werner accompanied by a list of synonyms. But after starting the work, he decided that it was inadequate treatment and therefore compiled a complete treatise, enriched by his own observations. He prepared this work by examining every systematic work of importance written in the German language. Brochant has assimilated the information into a superb treatise. He has closely followed the arrangement of Werner as delivered in lectures in 1800. His descriptions are compiled from

the collected authorities of all authors consulted. A list of synonyms is presented. In the second volume, the author makes announcements of recent discoveries and how they were made. He also includes species and other information not contained in Werner's original system. Brochant has added a sketch of geological arrangement, illustrated by descriptions of rocks, principally derived from field notes compiled by DAUBUISSON. Brochant has endeavored to select from the knowledge others have accumulated, rather present his own theories. When he ventures a remark it is for illustration only. Thus, he has made this work a vehicle for presenting Werner's theories to the mineralogists of France for them to determine the merits of the system he has expounded.

The directions to binder in vol. I instruct that the tables are to be bound in vol. II, but the directions in vol. II state that the additions to the volume have been so great that they must be bound separately. They are in fact sometimes bound into vol. II, but they are missing in this copy as in the University of Illinois copy described by Ward and Carozzi. Offered with a second copy of vol. II, untrimmed (130 x 225mm) in the original blue boards, rebaked, new endpapers, signature 'Ilchester' on half-title, also without the tables.

DE LA CRISTALLISATION, 1819

863. — French, 1819.

De | La Cristallisation | Considérée |
Géométriquement Et Physiquement, | Ou | Traité
Abrégé De Cristallographie, | Suivi D'un | Précis
De Nos Connoissances Actuelles | Sur Les |
Phénomènes Physiques De La Cristallisation. | Par
| A.J.M. Brochant De Villiers, | [...5 lines of titles
and memberships...] | [ornate rule] | A Strasbourg,

| De l'imprimerie de F.G. Levrault, imprimeur du
Roi. | 1819.

8°: [i]-vij, [8]-206 p., 16 plates (numbered I to
XVI). PAGE SIZE: 204 x 124 mm.

CONTENTS: [i-ii], Half title page, "De | La
Cristallisation | Considérée | Géométriquement et
Physiquement," verso blank.; [iii-iv], Title page, verso
blank.; [v]-vij, "Avertissement.;" [8], Blank.; [9]-190, Text.;
[191]-199, "Table Des Matières.;" [200], Blank.; [201]-206,
"Tableau Indicatif | des Figures.;" [At end], 16 plates.

PLATES: Of the 16 plates, the first 2 show
goniometers and apparatus, while the remainder show
crystal diagrams.

VERY SCARCE. Discusses the crystallographic
theories of Weiss, Beudant, Leblanc, Gay-Lussac, etc.,
but especially the principles laid down by Haiüy, with
whom he collaborated. Observations on geometrical
and physical properties are included. This work is
an expansion of the article Brochant prepared for the
Dictionnaire des Sciences Naturelle (Paris, ???). It is
written in such a manner as to provide the beginner
with a textbook but useful information to the expert as
well. The first part provides a geometrical description of
crystals based on Haiüy's theories. In this Brochant has
been helped by the careful examination of the collection
of the School of Mines. The second part theoretically
describes the physical phenomenon of crystallization,
which had occupied the authors studies for some time.

BROMELL

BROMELL, Magnus von. (BORN: Stockholm, Sweden, 26 March 1679; DIED: Stockholm, Sweden, 26 March 1731) *Swedish physician & mineralogist.*

The son of the physician O. BROMELIUS, Magnus chose the surname Bromell when he was raised to the nobility. From 1697 to 1704, Magnus had a far ranging education in Holland, England and France. Upon his return home he displayed a thorough knowledge of medicine, anatomy, chemistry and botany. Bromell became a professor of anatomy at the Collegium Medicum in Stockholm, before being elected head of the Institute in 1724. Being an accomplished chemist and mineralogist, Bromell was appointed to the Board of Mines, where in 1720 he was named assessor. On the death of U. HJÄRNE in 1724, Bromell succeeded him as head of the chemical laboratory.

VERY SCARCE. This modest, little mineralogy had a profound influence upon the subsequent development of mineral classification. Designed as a handbook to help the Swedish naturalist in their mineralogical studies it is written for a threefold purpose. First, to distinguish and recognize the principal minerals, and to instruct the reader upon the proper names of rocks and ores, their nature, habit and use. Second, to describe which types of useful minerals should be found in Sweden, and third, which metals and minerals had already been found in the kingdom. This last section emphasises those minerals and ores for which additional deposits needed to be located.

In this work, Bromell uses chapters to separate the divisions of the minerals, ores and petrifications. Within each chapter the properties of the group are described. By this method, the author developed a mineral classification that employs both physical and chemical properties. He divides minerals into earths, salts, sulphur and sulphurous rocks, stones, minerals and semimetals, and ores and metals. These divisions parallel the classifications of JOHN WOODWARD and URBAN HJÄRNE. Like Agricola, Bromell subdivides the earths according to their use, into medicaments, earths used by painters and dyers, earths used for cleaning and polishing, earths used in ceramics, fertilizers, earthy ores, and fuels. However, in this early attempt at physical-chemical distinction, for the class of stones, Bromell is the first mineralogist to group together species according to the more consistent property of the minerals behavior in fire.

Through his father, Bromell became a passionate collector of minerals and fossils. He had inherited the cabinet begun by his father and had considerably added to its numbers. While studying the collection, he became curious about the effect fire had on various specimens. Employing the crude qualitative techniques of the era, various samples of what were classified as stones by Bromell were placed in fire and the resulting reactions recorded. This led Bromell to categorize stones into four subdivisions: fire-resistant stones, stones that calcine, stones that become harder and stones that fuse and become glass. Since a stone's chemical composition ultimately determined its reaction in the fire, and therefore the category to which it was assigned, Bromell foreshadowed the more elaborate chemical classification system to be developed later by FRIEDRICH AXEL CRONSTEDT. Bromell also demonstrates by his emphasis upon describing the properties of minerals his interest in an orderly description of their natural characters.

BRONGNIART

BRONGNIART, Alexandre. (BORN: Paris, France, 5 February 1770; DIED: Paris, France, 7 October 1847) *French geologist & mineralogist.*

Alexandre was the brother of the famous French biologist, Adolphe-Theodore [1801–1876]. As a student, Brongniart had studied chemistry with A. LAVOISIER. In 1794, he graduated with a degree in mine engineering. He was appointed a professor of the Société Gymnastique from 1787 to 1794. From 1797, he was also a professor at the École Centrale, Collège des Quatre Nations. In 1800, he accepted the directorship of a porcelain factory in Sèvres, France. While there, he helped develop the science of ceramic chemistry. From 1818, Brongniart was the chief engineer of mines for the French nation.

TRAITÉ ÉLÉMENTAIRE DE MINÉRALOGIE, 1807

Paris, | Chez Deterville, Libraire, rue Hautefeuille, n° 8, | au coin de celle des Poitevins. | 1807.

2 vols. [VOL 1] 8°: π^6 A-Z⁸ 2A-2N⁸; 288 ℓ .; [i]-xij, [1]-564 p.; [VOL 2] 8°: π^2 A-Z⁸ 2A-2D⁸ 2E⁶; 224 ℓ .; [4], [1]-443, [1] errata p., 16 engraved plates printed on 15 folding ℓ . PAGE SIZE: 194 x 120 mm.

CONTENTS: [Vol 1] [i-ii], Half title page, "Traité | Élémentaire | De | Minéralogie," verso blank.; [iii]-iv, Title page, verso blank.; [v]-xij, "Préface."; [1]-564, Text.

[Vol 2] [2 pgs], Half title page, "Traité | Élémentaire | De | Minéralogie," verso blank.; [2 pgs], Title page, verso blank.; [1]-406, Text.; [407]-420, "Explication Des Planches."; [421]-443, "Table."; [1 pg], "Errata."; [At end], 16 plates on 15 folding leaves.

PLATES: Depictions on the 16 plates include apparatus, crystal drawings and diagrams, geological cross sections, mining equipment and building plans. The plates are signed in a fashion similar to Siadenier's sc.

SCARCE. Brongniart's *Traité* was the product of a commission to prepare a text for use in the mineralogical courses taught by RENÉ JUST HAÜY and the author at the *Faculté des Sciences* and the *Muséum d'Histoire Naturelle*. For this purpose, the author created a simple classification system based primarily on physical properties, but also influenced by Haüy's crystallographic theories. Brongniart insisted that studying how minerals occurred as well as their properties would lead to a better understanding of their origin. The work is largely directed to economic aspects of the science. The introduction is a thorough treatment of mineralogical principles, which is followed by an overview of the classification scheme, a table of the same

and a detailed descriptive mineralogy that extends to the second volume.

BRONN

BRONN, Heinrich Georg. (BORN: Ziegelhausen near Heidelberg, Germany, 3 March 1800; DIED: Heidelberg, Germany, 5 July 1862) *German geologist & paleontologist.*

Bronn studied at the University at Heidelberg where he took his doctor's degree in the faculty of medicine in 1821. The following year he was appointed professor of natural history. He now devoted himself to palaeontological studies, and to field-work in various parts of Germany, Italy and France. His principal work, *Letkæa Geognostica* (2 vols., Stuttgart, 1834-8; 3rd ed. with F. Romer, 3 vols., 1851-6), has been regarded as one of the foundations of German stratigraphical geology. In 1861 Bronn was awarded the Wollaston medal by the Geological Society of London.

BROOKE, Henry James. (BORN: Exeter, Devonshire, England, 25 May 1771; DIED: London, England, 26 June 1857) *English mineralogist & crystallographer*.

Brooke first studied law, but eventually became a merchant. He began in the Spanish wool trade, followed by ventures in South American mining companies and the London Life Assurance Association. As a pastime, he began to collect minerals. This collection subsequently passed to his son, who in 1857 presented it to Cambridge University, Dept. of Mineralogy. Brooke was elected a Fellow of the London Geological Society in 1815 and a Fellow of the Linnean Society in 1818. Eventually, Brooke was also elected a Fellow of the Royal Society in 1819. In his honor, the mineral “Brookite” was named after him by A. LÉVY in 1825.

On the Application of the Tables of Modifications.”; [232]-252, “Section XIV. [!] On the Use of Symbols for Describing the Secondary Forms of Crystals.”; [253]-282, “On the Relation of the Laws of Decrement to the Different Classes of Modifications.”; [283], “Appendix.”; [284], Blank.; [285]-392, “Appendix. Calculation of the Laws of Decrement.”; [393]-401, “On the Direct Determination of the Laws of Decrement from the Parallelism of the Secondary Edges of Crystals.”; [402]-438, “On the Methods of Drawing the Figures of Crystals.”; [439]-450, “On Mineralogical Arrangement.”; [451]-497, “An Alphabetical Arrangement of Minerals, with their Synonymes and Primary Forms.”; [498]-501, “Table of the Primary Forms of Minerals, arranged according to their Classes.”; [502]-508, “Index.”

VERY SCARCE. Dedicated to William Wollaston, inventor of the reflecting goniometer, this book proposes a new system of crystallographic notation. Brooke uses a method of letters and subscript figures to indicate crystal forms. For the primary forms or primitive, he chose the capitals P, M, T (from *primitive*). Secondary and other faces were noted with other letters in small type. Sweet (1978) suggests that this particular nomenclature was developed by Brooke from Count Bournon’s treatise on calcite, which allocated numbers to each form found.

This work had great influence on the course of crystallography during its time.

VERY SCARCE. A very popular series, this is a comprehensive encyclopedia of natural history, contemporary but independent of Buffon's *Histoire Naturelle*, which was started in 1763. Illustrated with 145 engravings, each showing several figures, Brooke extracts from the works of previous authors in his descriptions of the realms of nature, most notably Linnaeus. The introduction to volume one tells that the author had traveled to Africa and America, and that the work utilizes the systems of Ray and Linnaeus. The fifth volume is devoted to the earth and objects found within, and includes studies of minerals, fossils, volcanoes, earthquakes and magnets, which is illustrated with engraved plates. Brookes basically follows the theories of Linnaeus in his description of how minerals are classified.

The set has the following volume titles: Vol 1.

BROWN

Quadrupeds, Vol 2. Birds, Vol 3. Fishes and Serpents, Vol 4. Insects, Vol 5. Water, Earths, Stones, Fossils, Vol 6. Botany.

3rd edition, 1790: A New and Accurate System of Natural History. Third edition, corrected. London, MDCCXC. 6 vols. [Vol 1] 408 p.; [Vol 2] 317 p.; [Vol 3] 258 p.; [Vol 4] 324 p.; [Vol 5] 312 p.; [Vol 6] 322 p. Black and white illustrations are scattered through out the volumes. The fifth volume describes earths, stones, fossils, and minerals.

[4] p., 9 plates (4 folding). Plates at pages 4/5, 22,
38/39, 66, 85, and 120. PAGE SIZE: 198 x 150 mm.

CONTENTS: [2 pgs], Blanks.; [2 pgs], Title page, verso
blank.; [3 pgs], Dedication, signed Edward Brown.; [1 pg],
Blank.; [4 pgs], "To The | Reader."; 1-144, Text.; [2 pgs],
Publisher's list.; [1 pg], Errata.; [1 pg], Blank.

RARE. An observant traveler, Brown recorded all
the natural and historical objects and features he saw,
as well as anything the bore on his medical profession.
For his grand tour, he made a difficult tour through
the eastern regions of Europe. The present volume
is a pleasant account of his travels in the 1668-9s
through the mineral rich regions of Hungary, Austria,
and Carinthia, with observations on many gold, silver,
copper, mercury works. During 1668-9 Brown was
in Vienna and undertook the journeys he describes.
Like his near contemporary and fellow physician Martin
Lister (1638-1712), author of *A Journey to Paris* (1698),
Brown discourses on the geography, social customs and
history of the areas in which he traveled.

Facsimile reprint, 1971: New York, Arno Press, 1971.

878. Second edition, 1685: A brief account of some travels in
divers parts of Europe, viz. Hungaria, Servia, Bulgaria,
Macedonia, Thessaly, Austria, Styria, Carinthia, Carniola,
and Friuli. Through a great part of Germany, and the
Low-countries. Through Marca Trevisana, and Lombardy
on both sides of the Po. With some observations on the
gold, silver, copper, quick-silver mines, and the baths and
mineral waters in those parts. As also, the description
of many antiquities, habits, fortifications and remarkable
places. By Edward Brown, M. D. The 2d ed. with many
additions. London, Printed for Benj. Tooke, at the Sign of
the Ship in St. Paul's Church-yard, 1685.

2°: [4], 222, [4] p., illus., plates (part fold.)

VERY SCARCE. The first edition of 1673 had only 144 p.
and 9 plates and to this is added in this edition Brown's *An
Account of Several Travels through a Great Part of Germany*
(1677), and with the addition of *A Journey from Venice to
Genoa* (pp. 194-222).

881. — English, 1755 [First edition].

The civil and natural history of Jamaica. In three parts. Containing, I. An accurate description of that island ... with a brief account of its former and present state, government, revenues, produce, and trade. II. A history of the natural productions ... native fossils ... III. An account of the nature of climates in general, and their different effects

upon the human body. By Patrick Browne, M.D. London, Printed for the author, and sold by T. Osborne and J. Shipton, 1756.

2°: [4], viii, 503, [2] p., one folding map of Jamaica, a rare large folding map of Kingston and 49 copperplates (38 of flora, 11 of fauna) by George Dionysius Ehret.

VERY SCARCE. While a student, Browne began a lifelong correspondence with LINNAEUS, who inspired his researches in natural science, especially botany. When he moved to the West Indies, he made his important observations on the flora, fauna and geology of the island of Jamaica. Sabin reports that the print-run of the first edition was limited to only 250 copies. "All the copperplates as well as the original drawings used in the work were consumed in the great fire in Cornhill 7 Nov. 1765" (DNB). Most of the plates were drawn by Georg Dionysius Ehret [1708-1770].

Facsimile reprint, 1972: *The civil and natural history of Jamaica*. New York, Arno Press, 1972. viii, 503 p. illus., fold. map. Published as part of the series, *Research Library of Colonial Americana*.

882. 2nd edition, 1789: Civil and Natural History of Jamaica Containing I. An accurate Description of that Island, its Situation, and Soil; with a brief Account of its former and present State, Government, Revenues, Produce, and Trade. II. An History of the Natural Productions, including the various Sorts of native Fossils; Perfect and Imperfect Vegetables; Quadrupeds, Birds, Fishes, Reptiles, and Insects; with their Properties and Uses in Mechanics, Diet, and Physic. London, sold by B. White & Son, 1789.

2°: viii, 503, [48 (Linnaean Names, Index of Vegetables and Animals)] p., one folding map and 49 copper plates by George Dionysius Ehret. Errata following text. Includes bibliographical references and index.

VERY SCARCE. Second illustrated edition, generally considered to be the best edition, with four additional indexes.

Cundal Bibliographia Jamaicensis 416

Patrick Browne was born c.1720 at Woodstock, Claremorris, Co. Mayo and died at Woodstock in his native county. The Brownes of Woodstock, near Crossboyne, were a minor branch of the Brownes of Castlemacgarrett. Patrick received, his early education in Mayo and at the age of sixteen was sent to live with a relative in Antigua, one of the English islands in the Caribbean, which at that time had a substantial number of Irish-born landowners. A year later he returned to Europe to study medicine at the University of Paris. He graduated with the degree of Doctor of Medicine and went to London where he practised in St. Thomas's Hospital before returning to the West Indies around 1746. After spending ten years in Jamaica making his living as a physician, he returned to England, and brought with him a substantial collection of dried and pressed plants, preserved fishes and other zoological specimens. While there he commissioned the renowned botanical artist Georg Dionysius Ehret to prepare the illustrations for his proposed book. The first edition was published on 10 March, 1756, as Browne himself tells us in a letter to Linnaeus. The Civil and Natural History of Jamaica is considered one of the greatest natural history books of the eighteenth century, and in many respects second only to the earliest works of Carl Linnaeus, who wrote of Browne "you ought to be honoured with a Golden Statue". In this substantial work Browne

BRÜCKMANN

catalogued Jamaican plants and animals, classified the rocks and soils, and recounted briefly the history of the island and its government. More than half the book is devoted to the description of the native and cultivated plants of the island, with quite a substantial section on animals.

PSEUDODOXIA EPIDEMICA, 1646

883. — **English, 1646** [First edition, 2nd state].

[Contained within a double rule box:] Pseudodoxia Epidemica: | Or, | Enquires | Into | Very many received | Tenents, | And commonly presumed | Truths. | [rule] | By Thomas Brovvne Dr. of Physick. | [rule] | Iul. Scalig. | Ex Libris colligere quæ prodiderunt Authores longe est | periculosissimum; Rerum ipsarum cognitio vera è rebus ipsis est. | [rule] | London, | Printed by T.H.

for Edward Dod, and are | to be sold in Ivie Lane. 1646.

4°: a⁵ b⁴ A-Z⁴ Aa-Zz⁴ Aaa⁴ Bbb⁵; ??ℓ.; [20], 386 p. (Page nos. 251 and 317 misprinted 151 and 217.) PAGE SIZE: 274 x 186 mm.

VERY SCARCE. This is one of the author's great works marked by enormous research and learning. Browne attacks false traditions, superstitions and folklore relating to the nature of plants, animals, minerals, and man. Commonly refereed to as "Vulgar errors" (from the running header), it probably owes its creation to commonplace books compiled by Browne when traveling in Ireland and the Continent. However, the *Pseudodoxia Epidemica* also includes observations on a number of topics including physics, comparative anatomy and biology made by Browne himself. The first use of the word "Electricity" occurs on page 51 and the first use of the word "Mineralogist" occurs on page —.

FRANZ ERNST BRÜCKMANN

BRÜCKMANN, Franz Ernst. (BORN: Marienthal near Helmstädt, Germany, 27 September 1697; DIED: Wolfenbüttel, Saxony, Germany, 21 March 1753) *German physician & naturalist.*

In 1721, Brückmann went to Helmstadt study medicine. After graduating, he opened a practice in Braunschweig, then in 1728 he moved to Wolfenbüttel. From 1747 he was also held the position of Assessor for the Collegium Medicum in Braunschweig. His son was URBAN FRIEDRICH BENEDICT BRÜCKMANN, who wrote on gemstones and his adopted son was Friedrich Börner [1723-1761], who became a famous doctor. Brückmann wrote on a broad

range of subjects related to natural history and religion, and for support of his studies, he accumulated both a large library and collection of natural history objects. He was a member of the Berlin Academy and the Leopoldian Academy, to which he was elected on May 8, 1725.

[Supplement] No copy examined.

PLATES: Most of the folio sized, engraved plates of both parts are unsigned and numbered in Roman numeral. They illustrate various items discussed in the text, including minerals, scenic views, maps, and equipment.

[Part 1] Frontispiece. Picture of the head and torso of Brückmann within an oval frame behind a drawn curtain. The frame sits on top of a pedestal with the wording "Franciscus. Ernestus. Brückmann. Medicin. Doct. Brunsvicensis." The plate is signed Creite sc. in the lower left-hand corner. I. Mineral specimens & crystals. II. Scenic view. III. Mineral specimens & crystals. IV. Map. V. Mineral specimens & crystals. VI. Hoist house. VII-XI. Map. XII. Gold-Basche in America. XIII. The silver works at Potosi in Peru.

[Part 2] I-III. Mineral specimens & crystals. IV-VI. Mine plans. VII. Ornamental stone sample & mine plan. VIII-X. Mine plans. XI. Scenic view (folding). XII-XVII. Scenic views. XVIII. Map (folding). XIX-XXIII. Maps. XXV. Map & rock samples. XXVI. Minerals specimens & map. XXVII. Ornamental stone. XXVIII. Rock & geode samples. XXIX-XXX. Mine plans. XXXI. Scenic view. XXXII-XXXIII. Minerals specimens & crystals. XXXIV-XXXVII. Scenic views.

VERY SCARCE. This work is an early geographically divided guide to mining throughout Europe with references to mining in the New World. Part one uses individual chapters to treat the countries of Portugal, Spain, France, Germany, England, Scotland, Ireland, The Netherlands, Switzerland, Italy, Denmark, Norway, Sweden, Poland, Russia, Hungary, Turkey and Greece. There is also considerable additional discussion of mining activities in America and Spanish America. The text recounts various descriptions of individual mines and entire districts and the materials mined. These descriptions include frequent mention of the individual minerals processed, which in some cases are illustrated on the accompanying plates. Details are also included about the discovery and history of the mining operations. The second part retains the same format as the first, but greatly expands information by including much new material.

The very rare supplement describes the world fa-

mous mining works of Sweden and was published in Wolfenbüttel in 1734.

RARE. This is an early description of the naturally occurring fibrous substance generally called "Asbestos," that is now know to be one of the six minerals chrysotile, amosite, crocidolite, tremolite, anthophyllite and actinolite. Asbestos was known to the ancients and its miraculous property of resistance to burning was widely thought to be magical. The ancient Greeks used asbestos in their cloth and the Romans used it in their building materials. Here, Brückmann provides a short history and description of asbestos.

EXTREMELY RARE, in complete, unbroken sets. Although individual Epistola can be found. A highly interesting collection of letters covering many topics of interest to natural history, including mineralogy, geology, and zoology. Dedicated to Sir Hans Sloane and the Royal Society. It is particularly rich in material about the geology and fauna of the Harz region of

BRÜCKMANN

Germany. The first 72 letters give interesting and diverse accounts of excursions throughout Germany, with particular reference to paleontology. One section describes Brückmann's Museum of Metallic Specimens.

The *Epistolæ* seems to have been originally published separately, and each has an original title page of earlier date than the complete collection. Ferguson, J. (1906) says, "The *Epistolæ Itinerariæ* in three hundred numbers appeared between 1726-1753. They were afterwards collected in six volumes, with title pages. A list of those referring to mineralogy, etc., is contained in Leupold's *Prodromus Bibliothecæ Metallicæ* (Wolffenbüttel, 1732, p. 37)." However, Ferguson was incorrect, only 275 epistola were published, not 300.

Contents: The volumes comprise 275 separate "Epistolæ" or letters on a wide variety of subjects, each with their own title page and in many cases their own pagination. The general form for the title pages is they are printed in black with Brückmann's name and accomplishments at the top followed by the Epistola number, the title/subject of the letter, the addressee name and accomplishments and concluding with place of publication and year. For purposes of brevity the following list provides details only on the Epistola number, title, addressee, publication information and pagination.

[Volume 1]

I. De | Bibliothecis | Vindobonensibus | Praecipuis, | ... | Lavrentivm Hertel, | ... | Wolffenbvtellae, Anno Christi 1728. 4^o:)(4; no pagination; 1 plate showing a monster. [Text dated 1 October 1728].

II. De | Chrysocolia | A Neosoliensi | Hungarica, | ... | Johann. Heinric. Linck, | ... | Wolffenbvtellae, Anno Christi 1728. 4^o:)(4)(4^v blank). [Text dated 1 November 1728].

III. De | Bellariis Lapideis Liptoviensibus | Hungaricis, | ... | Johann. Heinric. Burchard, | ... | Wolffenbvtellae, Anno Christi 1728. 4^o:)(4, one folding plate (showing minerals). [Text dated 1 December 1728].

IV. De | IV. Figuratis Curiosis Rupibus Ad Faucibus Hercyniae Sylvae Prope Ilfeldam, | ... | Dom. Protectorem, | ... | Wolffenbvtellae, Anno Christi 1729. 4^o:)(4, 2 plates (scenic views). [Text dated 3 January 1729].

V. De | Templo Cathedrali Viennensi D. Stephano Dicato, | ... | Wolffenbvtellae, 1729. 4^o:)(4, one plate ("Tab. V"). [Text dated 1 February 1729].

VI. De | Ovo Gallinaceo | Figurato Et Terra | Vlricana, | ... | Dn. Ioh. David. Möllervm, | ... | Wolffenbvtellae, 1729. 4^o:)(4, one plate (St. Maria). [Text dated 1 March 1729].

VII. De | Figvratiss et Aliis | Qvibvsdam Cvriosis | Lapidibus | in | Electoratu Hannover Ano Obviis, | ... | Dom. Albertvm Ritter, | ... | Wolffenbvtellae, 1729. 4^o:)(4, 2 plates ("VI-VII," showing fossil shells). [Text dated 2 April 1729].

VIII. Sistens | Memorabilia | Bambergensia, | ... | Frid. Christian. Lesser, | ... | Wolffenbvtellae, 1729. 4^o: A4 B2, one plate (holy relic). [Text dated 1 May 1729].

IX. Sistens | Animalia Rariora | Viridarii Viennensis | Evgenii Francisci | ... | Avg. Wilh. Toepffer, | ... | Wolffenbvtellae, 1729. 4^o:)(4. [Text dated 1 June 1729].

X. De | Terrestri Cole | ... | Christ. Ge. Schwalbe, | ... | Wolffenbvtellae, 1729. 4^o:)(4, one folding plate (seeds). [Text dated 1 July 1729].

XI. De | Qvibvsdam Figvratiss | Hvngariae Lapidibus, | ... | Avgvst Ioh. Hvgo, | ... | Wolffenbvtellae, 1729. 4^o:)(4, one folding plate (fossil shells).

XII. De | Gigantvm | Dentibus, | ... | I.H. Mevschen, | ... | Wolffenbvtellae, 1729. 4^o:)(4, one

plate (tooth). [Text dated 1 September 1729].

XIII. De | Lapidibus | Odoratis, | ... | Andrea. El. Buchnervm, | ... | Wolffenbvtellae, 1729. 4^o:)(4. [Text dated 1 October 1729].

XIV. De | Remediis Qvibvsdam | Odontalgicis, | ... | Christoph. Jac. Trew, | ... | Wolffenbvtellae, 1729. 4^o: A4. [Text dated 1 November 1729].

XV. De | Farina Fossili | ... | Joh. Heinr. Linck, | ... | Wolffenbvtellae, 1729. 4^o:)(4. [Text dated 1 December 1729].

XVI. De | Sanctis Medicis, | ... | Joh. Bernh. Hassel, | ... | Wolffenbvtellae, 1730. 4^o:)(4, one plate ("XVI," St. Liborius). [Text dated 2 January 1730].

XVII. De | Sanctis Medicis | Et | Oleo Sanctae | Waldburgae | ... | Joh. Bernh. Hassel, | ... | Wolffenbvtellae, 1730. 4^o:)(4, one plate ("XVII," St. Waldburga). [Text dated 1 February 1730].

XVIII. De | Sactis Medicis | Et | Oleo | Sanctinicolai | ... | Joh. Bernh. Hassel, | ... | Wolffenbvtellae, 1730. 4^o:)(4; 4^l.; [1]-8. [Text dated 1 March 1730].

XIX. Sistens | Memorabilia | Qvedlinburgensia | ... | Fridr. Christianvm | Lesser, | ... | Wolffenbvtellae, 1730. 4^o:)(4, 2 plates (Vase & shield). [Text dated 4 April 1730].

XX. De | Tvberibvx Terræ | ... | Herm. Frid. Teichmeyer, | ... | Wolffenbvtellae, 1730. 4^o:)(4; 4^l.; [1]-8 p., 2 plates (Stones & roots and nuts). [Text dated 1 May 1730].

XXI. De | Medicis Viennensibus | Anno MDC-CXXIII. MDCCXXIV. MDCCXXV. | Eorvmque | Scriptis Medicis | ... | Christ. Georg. Schwalbe, | ... | Wolffenbvtellae, 1730. 4^o:)(4. [Text dated 1 June 1730].

ABHANDLUNGEN VON EDELSTEINEN, 1757

893. — German, 1757 [First edition].

U.F.B. Brückmanns, | der A.W. Doctors, | Herzogl. Braunsch. Hofmedicus und Professors | bey der Anatomie, | Abhandlung | von | Edelsteinen, | nebst | einer Beschreibung | des so genannten | Salzthalischen Steins. | [ornament] | [ornate rule] Braunschweig, | verlegt die Fürstl. Waysenhausbuchhandlung. | 1757.

8°: A-J⁸)(4 (J8 blank); 76ℓ.; [1]-143, [9] p. PAGE SIZE: 190 x 120 mm.

CONTENTS: [1-2], Title page, verso blank.; [3]-5, "Vorrede."; 6-8, "Eintheilung der Edelsteine | überhaupt."; [9]-143, Text.; [1 pg], Blank.; [8 pgs], "Register."

RARE. A remarkable book that incorporates Brückmann's personal observations of gemstones, minerals and fossils under an umbrella of a general treatise on precious stones. Throughout the text, the author displays his extensive knowledge of the subject, incorporating numerous quotations and citations to the mineralogical literature of the time, while giving his own perceptive views on the subject under examination. The classification he adopts to arrange the stones is an innovation. Through his father's extensive collection, Brückmann had considered mineralogical subjects his entire life, and the insight he brings to his descriptions shows the extent of gemological knowledge of the 18th century. Sinkankas gives a full description.

894. 2nd edition, 1773: Urban Friederich Benedict | Brückmann, | der Arzneywissenschaft Doctor und Herzogl. Braun= | schweigischen Leibmedicus, | Abhandlung | von | Edelsteinen. | [ornament] | [rule] | Zweyte verbesserte und vermehrte | Auflage. | [double rule] Braunschweig, | im Verlag der Fürstl. Waysenhaus=Buchhandlung | 1773.

8°: A-Cc⁸; 208ℓ.; [1]-415, [1] p. Title vignette. PAGE SIZE: 196 x 120 mm.

CONTENTS: [1-2], Title page, verso blank.; [3]-[6], Dedication, dated 26 April 1773.; [7]-[12], "Vorrede."; [13]-[14], "Eintheilung der Edelsteine überhaupt."; [15]-16, "Anmerkung."; [17]-358, Text.; 359-388, "Anhang | Von den größtentheils unbekannten | sogenannten Edelsteinen."; 389-415, "Register."; [1 pg], Blank.

RARE. Rewritten and enlarged edition with the addition of many new stones, and a valuable appendix, "Von den größtentheils unbekannten sogenannten Edelsteinen" (pp. 359-388), that attempts to identify the so-called gemstones of the ancient writers. As Sinkankas writes: "This glossary is unique and deserves to be translated with an interpretation in the light of modern knowledge; there are hundreds of terms and I know of no other place in the literature where a similar glossary of ancient gemological/mineralogical terms exists." Brückmann also expands his system of classification incorporating new categories and ornamental materials such as marble, granite, etc. Since the appearance of the first edition in 1757 the author had researched extensively to write this enormously enlarged treatment. He carried on his research issuing two supplemental parts that are described below.

BRÜCKMANN

Sinkankas, *Gemology Bibliography*, 1993: no. 975.

895. First suppl., 1778: Urban Friederich Benedict Brückmanns, | [4 lines of titles and memberships] Gesammlete und Eigene | Beyträge | zu seiner | Abhandlung | von | Edelsteinen. | [vignette] | [rule] | Braunschweig, | in der Fürstl. Waisenhaus=Buchhandlung. 1778.

8°: *4 A-P8 Q-R4; 132ℓ.; [8],[1]-252, [4] p. PAGE SIZE: 195 x 110 mm.

CONTENTS: [2] pgs, Title page, verso blank.; [6] pgs, "Vorrede."; [1]-252, Text.; [4] pgs, "Register."

RARE. This supplement enhances and expands the basic text of *Abhandlungen von Edelsteinen* (2nd ed., Braunschweig, 1773), giving additional citations to the literature and additional locality information. Brückmann also incorporates the results of various chemical analysis on stones he has examined and reviews of the latest discoveries in mineralogy, as it pertains to gemological studies. Interestingly a large amount of information on the synthetic manufacture of various minerals and gemstones is incorporated, including descriptions of how to determine fake stones. This is among the first works to treat the subject of mineral synthesis.

VERZEICHNISS, 1813

899. — German, 1813 [Sale catalog].

Verzeichniß | einer vollständigen | Mineralien-Sammlung, | welche | aus allen Theilen dieses weitläufigen Fachs, | sowohl roh, als geschliffen und bril- | lantirt besteht, | und in einem Zeitraume von mehr als 60 Jahren | mit | Sach-Kenntniß, vieler Mühe und grossem | Kostenaufwande | von dem | vorstorbenen Herzogl. Braunschweig Leibarzte | Urban Friedr. Bened. Brückmann | zu Braunschweig | zusammengebracht worden ist. | [double rule] | Braunschweig 1813, | gedruckt bei Johann Heinrich Meyer.

8°: [i]-viii, [1]-432 p. PAGE SIZE: 186 x 104 mm.

VERY RARE. Auction sale catalog of Brückmann's gem and mineral collection, which he had amassed through over 60 years of collecting, with great effort and much expense. As would be expected from his textbook on gemology, Brückmann had a particular fondness for gem minerals and these are represented throughout the catalog in both cut and natural crystal specimens. Over 6,000 lots are described in the text. The sale took place after Brückmann's death, and was initiated by his heirs.

900. Dissertation, 1781: Sebalde Justin | Brugmans | Lithologia Groningana, | Ivxta Ordinem Wallerii | Digesta, | Cvm Synonymis Aliorum, Imprimis | Linnaei Et Cronstedii. | Cvm Figvris Aeneis. | Pvblice Defensa, | Cvm Svmmos In Philosophia Honores, | In Academia Groningo-Omlandica | Consequeretvr. | [ornate rule] | Groningae. | [double rule] | Apud P. Doekema & R. Muller. | MDCCLXXXI.

8°: π^4 A-H4; [8], [1]-120 p., one hand-colored engraved plate (showing 8 figures of mineral specimens). Only in some copies is the plate colored. PAGE SIZE: 228 x 140 mm. uncut

CONTENTS: [2 pgs], Title page, verso blank.; [1 pg], Dedication to Petro van Bleiswyk.; [1 pg], Blank.; [4 pgs], "L.S." [=preface].; [1]-120, Text.

RARE. This dissertation describes the minerals and rocks found around Groningen in The Netherlands. The descriptions are digested into the mineralogical system of J.G. WALLERIUS. Synonyms from the writings of LINNEAUS and CRONSTEDT are provided for the individual items. The plate gives illustrations of several specimens. This work was publicly defended by Brugmans to obtain a philosophical degree from the Academy at Groningen.

CONTENTS: [i-ii], Title page, verso "Verlags-Nr. 816."; [iii], "Vorwort."—signed W. Bruhns, May 1902.; [iv], "Berichtigung."; [v]-vi, "Inhalt."; [1 pg], "Corrigenda."; [1 pg], Blank.; [1]-204, Text.; [205]-211, "Register."; [1 pg], Blank.

SCARCE. Written for the beginner interested in crystallography, this *Elements of Crystallography* provides a good introduction to the science. The first part (pp. 1-23) covers general material like definitions, crystal measurement and projections. The next section (pp. 24-116) describes the crystal forms (cubic, tetragonal, hexagonal, trigonal, monoclinic, and triclinic), and twinning. The final part (pp. 117-184) describes physical crystallography, including cohesion, etch figures, elastic deformation, hardness, and the optical, thermal, magnetic and electrical properties of crystals. At the conclusion are short discussion of the relationship between chemistry and crystal form, an overview of the 32 classes of crystal forms and an index to the text.

Leipzig, | in der von Kleefeldschen Buchhandlung. | 1804.
8°: [*]-***8 A-S8 T7 U8 X4; 187 ℓ .; [i]-xlviii, [1]-326 p. PAGE SIZE: 177 x 97 mm.

CONTENTS: [i-ii], Title page, verso blank.; [iii-iv], Dedication to Jena Mineralogical Society, verso blank.; [v]-xlviii, "Vorrede."—dated January, 1803; [1]-52, "Einleitung."; 53-70, "Uebersicht. | Eigentliche oder ursprüngliche Mi= | neralien."; 71-74, "Neue und fremdartige Mineral= | ien."; [75], "System | der | Oryktognosie."; [76], Blank.; 77-245, "Eigentliche Mineralien."; 246-266, "I. Anhang. | Neue und

fremdartige Mineralien = | lien.”; 267-275, “II. Anhang. | Namen der Mineralmenge.”; 276-302, “III. Anhang. | Chemische Verwandtschaft der | Mineralien.”; 303-326, “Alphabetisches | Verzeichniß | der | Mineralien.”

VERY SCARCE. Completely revised edition, based on Lenz's *Mineralogisches Taschenbuch* (Erfurt, 1798-9). Brunner's mineralogical system offered little that was either new or interesting. Typical of the period, the external characters play a great part, and the chief divisions are Earths, Salts, Bitumens and Metals. The first of these is subdivided according to structure into earthy or powdery, fine bladed, leafy, star-like, fibrous, fine-grained and dense or compact. The salts are split according to their taste into sour and sweet assemblages. The volume begins with discussions of color, external form, fracture, and luster. An overview of the system is then presented, followed by the complete system including a section devoted to new minerals. The book concludes with an index to minerals mentioned.

Forsteeninger, (Petrificata).”; [313]-320, “Dansk Register.”; [1 pg], Errata, “Trykseil og Kettelser.”; [1 pg], Blank.

RARE. This is the author's complete introduction to mineralogy. It emulates the work of Johan Gotschalk Wallerius [q.v.] upon which it is based by including in the species descriptions notes on synonymes, hardness, physical appearance, origins, and uses. In addition, every mineral listed has a reference to Wallerius' system as presented in *Systema Mineralogicum* (1st ed., Holmiæ, 1772-5). Brünnich adopts a classification system founded on chemical principles that provides

BRÜNNICH

a good foundation for the logical organization of the species.

The preliminaries of the work include a short passage on why this work should be used, a list of literature cited, and a general introduction to mineralogical science covering some definitions and general remarks. The text then presents the classification of the mineral species. This systematic portion is divided into five classes: (1) earths and stones, (2) salts, (3) flammable substances, like pitch and amber, (4) metals and (5) petrifications. An index in Danish to the mineral names and a page of errata conclude the work.

Georgi, 12-23 October 1780.; [4 pgs], "Einleitung."; [1]-328, Text.; 329-347, "Register."; [1 pg], Blank.; [4 pg], "Einleitungstabelle."

VERY SCARCE. Translated by Johann Gottlieb Georgi [see note below] from *Mineralogie* (Kjøbenhavn, 1777). This

edition contains for the additional species and a notice of hitherto unknown Russian minerals by the translator, who spent many years in Russia making numerous mineralogical expeditions.

The preliminaries include Brünnich's letter to the reader, a forward from the translator and a short introduction. The translation of the text is presented, concluding with a species index and an overview of the classification system.

Johann Gottlieb Georgi. (BORN: Gut Wachholzhausen, Pommern, Germany, 31 December 1729; DIED: St. Petersburg, Russia, 27 October 1802) *German apothecary*. Georgi established an apothecary in Stendal, but moved his establishment in 1770 to St. Petersburg. Using this as a home base he made many explorations in the Russian territory. In 1783, he was elected a member of the Academy of Science in St. Petersburg.

BRUSH

BRUSH, George Jarvis. (BORN: Brooklyn, New York, U.S.A., 15 December 1831; DIED: New Haven, Connecticut, U.S.A., 6 February 1912) *American mineralogist & university administrator.*

Brush graduated from Yale in 1852. Having decided upon a career in mineralogy and chemistry, he traveled to Freiberg, enrolling at the Bergakademie in 1853. There he was instructed by J.F. BREITHAUPT, who stimulated his already intense interest in the composition of minerals. Upon his return to America, Brush was made an assistant in chemistry at the University of Virginia. However, this was followed soon after by an appointment as professor of metallurgy at Yale University, a post he held from 1855 to 1871. In 1868, he happily added the title of professor of mineralogy, an appointment he retained throughout his subsequent positions until his retirement in 1898. He became director of the Sheffield Scientific School in 1872 and as administrator showed a gift for the position. Even with his time stretched running the school, Brush still found time to teach his favorite subject of mineralogy to new pupils. Throughout his life he amassed a fine personal collection of over 15,000 mineral specimens, which was bequeathed to the Yale Peabody Museum. In 1983, the family donated a large accumulation of Brush letters and mementos to Yale University. Included in the collection are a large number of letters from important mineralogists.

Fifth Edition System Appendix

913. — English, 1872 [5th edition, first appendix].

First Appendix | To The | Fifth Edition | Of | Dana's Mineralogy, | by | George J. Brush, | Professor Of Mineralogy In The Sheffield Scientific School Of Yale College. | Completing The Work To 1872. | New York: John Wiley & Sons, | 15 Astor Place. | 1872.

8°: [i]-iv, [1]-19, [1] p., illus. PAGE SIZE: 232 x 145 mm.

CONTENTS: [i-ii], Title page, verso "Entered according to Act of Congress, in the year 1872, by | John Wiley & Son, ..."; [iii]-iv, "Prefactory Note."; [1-19], Text.; [1 pg], Blank.

SCARCE. This first appendix prepared for JAMES DWIGHT DANA's *System of Mineralogy* (5th ed., New York, 1868) contains descriptions for eighty-seven minerals proposed as new since the publication of the that work. In addition, it contains new information about some older mineral species. Each new mineral is given a Dana number showing its place in the system.

914. 5th edition, first appendix, 1873: Appendix | To The | Fifth Edition | Of | Dana's Mineralogy, | By | George J. Brush, | Professor Of Mineralogy In The Sheffield Scientific School Of Yale College. | [rule] | New York: | John Wiley & Son, | 15 Astor Place. | 1873.

8°: [i]-iv, [1]-18 p. PAGE SIZE: 232 x 143 mm.

CONTENTS: [i-ii], Title page, verso "Entered according to Act of Congress, in the year 1872, by | John Wiley & Son, | ..."; [iii]-iv, "Prefactory Note."; [1]-18, Text.

SCARCE. A reset issue of the first appendix to the fifth edition of Dana's *System* (New York, 1868) which has kept the four preliminary pages unaltered, but has reset the text to now exist in 18 pages instead of the original 19 by the elimination of all illustrations. This particular issue of the appendix appears to only exist bound up with the 1874 London issue of Dana's fifth edition.

915. — English, 1875 [First edition].

Manual | Of | Determinative Mineralogy | With An Introduction | On | Blow-Pipe Analysis. | By | George J. Brush, | Professor Of Mineralogy In The Sheffield School. | [ornate rule] | New York: | John Wiley & Son, | 15 Astor Place. | 1875.

8°: [i]-iv, [2] contents, [1]-104 p., pages 63 to 96 are printed as folding double-leaf tables, 25 illus., index. PAGE SIZE: 222 x 136 mm.

CONTENTS: [i-ii], Title page, verso "Entered according to Act of Congress, in the year 1874, by | Geo. J. Brush, | ..."; [iii]-iv, "Preface."—dated 15 December 1874; [2 pgs], "Table Of Contents."; [1]-12, "I. Apparatus and Reagents."; [13]-32, "II. Systematic Course of Blowpipe Analysis."; [33]-56, "III. Alphabetical List of

BUC'HOZ

Elements and Compounds with Characteristic Blowpipe and other Reactions.”; [57]-96, “IV. Determinative Mineral,” containing “Tables for the Determination of Mineral Species by Means of simple chemical experiments in the wet and dry way. | Translated from the tenth edition of Franz von Kobell’s “Tafeln zur Bestimmung der Mineralien.”; [97]-104, “Index To Minerals | in | Chapter IV.”

SCARCE. This is one of the best textbooks on the subject of determinative mineralogy using the blowpipe. It was intended, in accordance with an original plan between JAMES DWIGHT DANA and Brush to be the Determinative Part of Dana’s *System of Mineralogy* (5th ed., New York, 1868), for which Brush had contributed the pyrognostic material. Certainly, from its first issue it is was the mostly widely used text on the subject within American universities and colleges. The author calls this work a compilation based on the tenth edition of Von Kobell’s *Tafeln zur Bestimmung der Mineralien* (München, 1873). While this is true, Brush also added extensively from his own vast experience of blow-pipe reactions in minerals. Moreover, in inspired innovation, the species, with their blowpipe characters, are arranged in a series of extended tables, which when used properly lead the student to the name of the mineral that was being examined based upon the reactions observed. These tables include all species known to the time of publication.

REFERENCES: *American Journal of Science*: 3rd Series, 9 (1875), 153. • Dana’s 7th (Bibliography): 68. • NUC: 81, 141-3 [NB 0896953 & NB 0896969].

916. 15th edition, 1898: Manual | Of | Determinative Mineralogy. | With An Introduction On | Blowpipe Analysis. | By George J. Brush, | Director of the Sheffield Scientific School of Yale University. | Revised And Enlarged, With Entirely New Tables | For The Identification Of Minerals. | By | Samuel L. Penfield, | Professor of Mineralogy in the Sheffield Scientific School | of Yale University. | Fifteenth Edition. | First Thousand. | New York: | John Wiley & Sons. | London: Chapman & Hall, Limited. | 1898.

8°: [i]-x, [1]-312 p., illus., tables.

SCARCE. Co-authored with SAMUEL L. PENFIELD. Although the title page proclaims this the fifteenth edition, it is in fact a major revision to Brush’s original work. The consequence being this is the finest textbook on the use of the blow-pipe ever written in the English language.

REFERENCES: Dana’s 7th (Bibliography): 68.

BUC’HOZ, Pierre Joseph. (BORN: Metz, France, 27 January 1731; DIED: Paris, France, 30 January 1807) *French botanist & naturalist.*

Buc’hoz was the son of Pierre Brughant, Bourgeois of Metz. He was persuaded to follow his father’s profession and he embarked on a career to practice law. However, Buc’hoz did not find the profession agreeable and instead moved to Nancy where he took up the study of medicine, graduating on February 22, 1763. He was appointed physician ordinary to King Stanislas of Poland, but was accused of not fulfilling his duties and quit to devote his full energy to the study of botany. He collaborated on the founding of the Jardin des Plantes at Nancy, and for twelve years co-edited a newspaper on agriculture.

Buc’hoz eventually settled in Paris where he made a living by preparing many illustrated works about the three realms of natural history. In 1788, to mend his finances, Buc’hoz sold at auction his large library concerned with natural history.^[1] He petitioned the French government for a pension, and to support his claim he published a

bibliography of his own works, *Dissertation en forme de catalogue des différents travaux de J.-P. Buchoz dans la carrière botanique pendant plus de cinquante ans.* (Paris, 1794). Buc’hoz held membership in the academies of Metz, Nancy, d’Angers, Béziers, Bordeaux, Châlons-Saint Marne, Lyon, Rouen and Mayence.

Buc’hoz was a prolific author, who on the title pages of his many publications, usually reversed his christian names [i.e. Joseph Pierre, not Pierre Joseph]. However, his writings in science and natural history developed a bad reputation owing to their inaccuracies and the incomplete understanding of the author about the subjects. This has caused Buc’hoz to be labeled the Sir JOHN HILL of France. Buc’hoz’ reputation today is perhaps best summed up in the Hunt Catalog: “Buc’hoz is not beloved of botanists, bibliographer’s or collectors of prints. He has a maddening way of using the same plates again and again and again, in book after book—sometimes colored, sometimes uncolored, sometimes badly colored, sometimes reversed, sometimes redrawn, sometimes with added details, sometimes with changes to nomenclature.” As can be seen from the descriptions of his mineralogical works, this is a fair assessment.

PREMIER CENTURIE DE PLANCHES, 1778

| Mlle. Niquet, Scrip.

[TITLE PAGE OF SECOND VOLUME READS:]

[Engraved title printed in red and contained within a ornate double ruled box:] *Seconde Centurie | De Planches | Enluminées | Et Non Enluminées | Representant Au Naturel | Ce qui de trouve | de plus Intéressant et de plus Curieux | parmi | Les Animaux, Les Vegetaux, Et Les Minéraux, | Pour servir | d'intelligence à l'Histoire Generale | Des Trois Regnes De La Nature. | Par M. Buc'hoz | Medecin Botaniste de Monsieur. | Et Auteur des Dictionnaires des trois Regne de la France. | Decade 1^{re}. | Regne Animal. | A Amsterdam. | Chez Marc-Michel Rey, Libraire. | 1778.*

2 vols. Folio, consisting of a total of 20 suites of plates, each with an engraved title page, engraved table of contents, and 10 subjects each in uncolored and colored impression. These plates are divided into "centurie" of 100 subjects per volume for a total of 200 plates (colored and uncolored), making together 400 plates between the two vols. This remarkable work has no general title page; however, each "decade" or livraison has its own engraved title page, which varies in minor detail and color from one decade to another. The titles transcribed above being the title pages from the first "decade" of the first "centurie," which dealt

BUC'HOZ

with the animal kingdom. PAGE SIZE: 505 x 335 mm.

RARE. A little known, finely illustrated natural history covering the three realms of plants, animals and minerals. It is one of the best known works of the prolific Buc'hoz, and because of the author's reuse of the plates in later works, a difficult bibliographic problem. The work contains no text, but consists of a series of plates in royal folio. On unstated evidence, both Brunet and the BMC date the work "(1775) 1778–1781." Since no "decade" of the first volume contains any date, there is no direct reason for dating the first volume in 1775; however, the decades of the second volume are dated Amsterdam, 1778 (nos. 1–3); Paris, 1778 (no. 4); Amsterdam, 1779 (no. 5) and 1780 (no. 6); Paris, 1780 (nos. 7, 8); and Paris, 1781 (nos. 9, 10).

Premier [–Seconde] Centurie des Planches appears to be the first appearance of any portion of the work as it relates to mineralogy. Complete copies of the book are usually bound in 2 volumes, each covering 100 subjects or one "centurie." It is from this grouping that the designation of Premier or Seconde Centurie as used in the title is derived. The two volumes contain 20 suites of large folio engraved plates, each with an engraved title page (most printed in colors other than black), an engraved table of contents and plates illustrating 10 subjects. Each of the subjects is present in both uncolored and hand-colored impression making the complete 2 volume work total 400 plates (200 uncolored plates of subjects, 200 colored).

Each "decade" is devoted to a natural kingdom—animal, vegetable or mineral, in that order—each volume thus having "decades" 1, 4, 7 and 10 devoted to animals, 2, 5, and 8 to plants, and 3, 6, and 9 to minerals and fossils. Therefore, within this work there are 80 different plates (in both colored and uncolored state) depicting animals, and 60 each showing plants and minerals. As there is essentially no accompanying text, the merits of this book must rest on the quality of the illustrations, and although sometimes crude they are among the finest colored illustrations of minerals created in the eighteenth century.

Unreserved praise must go to the numerous artists who designed Buc'hoz' plates [see notes below]. Greatest among these was Jean Baptiste Desmoulins. Buc'hoz was also fortunate in retaining several of the foremost engravers of the times such as C. Bacquoy, Dupin fils and C. Fessard. These artisans and others engraved and magnificently hand-colored the plates of this work. In fact it is reported that after he became a widower, Buc'hoz married one of the lady colorists who had worked on this book. It can also be observed that a number of the mineralogical specimens illustrated have been copied directly from the works of other authors like KNORR and SCHMIEDEL.

Claude Mathieu Fessard. (BORN: Fontainebleau, France, 1740; DIED: Paris, France, After 1803) *French engraver & etcher.* Fessard was a student of the great French artist Joseph de Longueil [1730–1792]. He travelled to England in 1765 to expand his experience, after which he illustrated several books of voyages and travels, including P.S. Pallas' *Voyage en Russie* (Paris, 1788–93). Fessard

signed his work "Fessard jeune" in order to distinguish it from the engravings of Etienne Fessard [1714–1777].

Jean Victor Dupin. (BORN: Paris, France, 1718; DIED: Paris, France?,) *French engraver.* Dupin was the son of the renowned engraver Pierre Dupin [1690–1755?], with whom he worked in his early career. Jean Victor usually signed his work "Dupin fils."

Jean Baptiste Desmoulins. (BORN: Paris, France, 1740; DIED:) *French engraver.* French copper engraver who worked in Paris and collaborated with Abbé de Saint–Non.

Jean Charles Baquoy. (BORN: Paris, France, 16 June 1721; DIED: Paris, France, 24 February 1777) *French engraver.* French copper engraver who signed his work C. Baquoy and belongs to the greatest vignette engravers of the eighteenth century.

CONTENTS: [2 pgs], Engraved title page, verso blank.; 100 hand-colored plates.; [7 pgs], "Explication | Des Planches.; [1 pg], Blank.

VERY RARE. *Les Dons Merveilleux ... Regne Minéral* is a marvelously illustrated work focused on mineralogical subjects. Is a reissue of the sixty colored plates first published in 1775–81 in *Première [–Seconde] Centurie des Planches* (2 vols., Paris, 1775–81), together with forty additional plates that appear for the first time. Although it is in the same style of the previous work and consists primarily of plates of illustrations, the large number of additional plates show that this volume

LES DON'S MERVEILLEUX, 1782

DICTIONNAIRE MINÉRALOGIQUE, 1772

should be considered a separate, new work.

Brunet dates this work as "1782-97," which indicates the work was issued in a series of parts. However, no direct evidence has been uncovered to support this contention. Although it would seem likely that Buc'hoz would have sold this work through a subscription system by periodically preparing additional plates for the book, no wrappers, advertisements or other evidence has been found. Only circumstantial support comes from a relatively large number of copies of this work being described as having fewer than 100 plates; that number usually being 88. In addition, the last 40 plates are new, with no indication of "Decade." Instead, each plate although unnumbered, has in its upper right-hand corner a "Pl." designation.

BUCH

RARE. Work of this eminent German geologist including the first geological map of Schlesien from the year 1797 with 10 different colours depicting the "Riesen-Gebirge" near Breslau now in Poland, but also dealing with the mineralogy and geology of the "Salzkammergut" near Berchtesgaden and Salzburger Land. The second volume begins as a mineralogical letter from Leopold von Buch to K.G.L. Karsten, and it deals with the Monte Albano and Puy de Dôme. The illustrations and maps of the Puy de Dôme near Clermont-Ferrand are especially of interest.

Die | Meteoriten | In Sammlungen, | Ihre Geschichte, Mineralogische Und | Chemische Beschaffenheit. | Von | Dr. Otto Buchner. | [ornate rule] | Leipzig, | Verlag Von Wilhelm Engelmann. | 1863.

8°: xxvi, 202 p.

RARE. A remarkable work giving a comprehensive look at the known meteorite falls, their mineralogy, the chemical composition of specimens, the major meteorite collections with a listing of the falls represented, and methods used in cataloging the collections. To help determine a falls monetary worth, Buchner listed not only the meteorites localities held in various public and private collections, but also the weight of each of the 263 falls represented.

BUCKLAND, William, Reverend. (BORN: Axminster, England, 1784; DIED: Oxford, England, 14 August 1856) *English geologist, mineralogist & clergyman.*

He was dean of Westminster from 1845. First to note in England the action of glacial ice on rocks, he did much to bring physical and natural science into high repute and was responsible for giving Oxford (where he was a student and later a fellow) an international name in science. He wrote *Reliquiae Diluvianae* (1823) and *Geology and Mineralogy Considered with Reference to Natural Theology* (1836). Francis T. Buckland, English surgeon and naturalist, was his son.

William Buckland may not be a household name, but to dinosaur lovers the world over, he should be. Professor of

BUCKLAND

BUCKLAND

Geology at Oxford, Buckland is responsible for the world's first description of a recognized dinosaur fossil, although the term "dinosaur" didn't exist at the time. In 1824, Buckland published *Notice on the Megalosaurus or Great Fossil Lizard of Stonesfield*.

In the same science meeting where he described *Megalosaurus* Buckland also announced – reassured by Cuvier that it was correct – the first fossil mammal from the Age of Reptiles. In its own way, this tiny mammal fossil was as surprising as the giant reptile he had just named. Conventional wisdom of the time said mammals came only after the great reptiles. Years later, Buckland tried to resolve the controversy he had raised by suggesting that the mammal was an "inferior" marsupial.

Buckland's discoveries in paleontology were as varied as they were distinguished. In 1822, in *An Assemblage of Fossil Teeth and Bones*, he described a feeding frenzy of ancient hyenas based on fossil remains. That same year he discovered an ancient human skeleton. He initially and correctly identified it as male, but later reversed the decision and proclaimed the skeleton not only female but also (perhaps in jest) a witch! After calling it the Red Witch, he finally gave the skeleton the more palatable name of the Red Lady of Paviland.

Unlike the scriptural geologists of his day, Buckland did not hold to a literal interpretation of Genesis, especially in terms of geologic time. Nevertheless, he was a deeply religious man who devoted much of his life to supporting scripture with geology, attracting criticism from theologians and scientists alike. Buckland had an open mind; persuaded by Louis Agassiz and his own observations, he eventually traded his belief in the diluvial theory for support of the Ice Age theory. And Buckland was a fantastic popularizer of science who had the grace not to take himself too seriously. One of his students recounted how Buckland once

... rushed, skull in hand, at the first undergraduate on the front bench – and shouted, "What rules the world?" The youth, terrified, threw himself against the next back seat, and answered not a word. He rushed then on me, pointing the hyena full in my face – "What rules the world?" "Haven't an idea," I answered. "The stomach, sir," he cried. In another lecture, Buckland happily strutted about the room imitating the gait of giant birds he believed left their footprints in ancient deposits. (The "birds" could well have been bipedal dinosaurs.) Afterwards, one of Buckland's high-minded colleagues scoffed, "the grossness of the Buffoonery acted on me like an emetic."

Whittingham, Took Court, Chancery Lane | [rule].”; [v]-vii, “List Of Engravings.”; [1 pg], Blank.; [1]-110, “Explanation Of The Plates.”; [Plates 1-69, part folding, geological & palaeontological subjects.]; [111]-128, “Index.”

SCARCE. In this work, Buckland helped redefine the role of science and theology. Geologists of the day wanted to produce a detailed explanation that would constitute a geological history, period by period, of the events of a given locality ... Buckland was perhaps the best able of the British geologists and probably the most acute to build a careful local stratigraphy and local dynamic explanations collaborated with the addition of fossil evidence.

BUCQUET, Jean Baptiste Marie. (BORN: Paris, France, 18 February 1746; DIED: Paris, France, 24 January 1780) *French physician & chemist.*

Bucquet first studied law, but turned to medicine and chemistry, and began giving private chemical lessons around 1769. In 1776, he was appointed professor of chemistry and natural history at the École de Médecine. He collaborated with Lavoisier in work on gases and their effects on substances. He was a member of the Paris Académie des Sciences.

PAGE SIZE: 230 x 145 mm.

RARE. This is a privately published offprint by Robert Clifford of his translation first published in the *Philosophical Magazine* (nos. 74-75, 1804) under the title “A letter from Abbé Buée to Mr. ****, on Mr. Romé de l'Isle and the Abbé Haüy's theories of crystallography.” Originally written in French, Buée had authored the letter in order to contrast the differences between the crystallographic systems of Romé de l'Isle and Haüy, which at the time were both considered similar in nature. It is an important critique of Romé de l'Isle's system, which Buée characterizes as primarily descriptive, as opposed to Haüy's mathematically based system. Buée shows that Romé's selection of primitive forms was arbitrary, where as Haüy's was based upon direct observations of the crystals. The original article was reprinted in Nicholson's *Journal* (vol. 9, 1804) under the title “Outlines of the Mineralogical Systems of Romé de l'Isle and the Abbé Haüy: with Observations.” There it is introduced by a letter from R. Clifford who translated

it from Buée's original French. At that time Buée was in England having fled Paris and the Reign of Terror.

BUFFON

BUFFON, Georges-Louis Leclerc, Comte de. (BORN: Montbard, Côte d'Or, France, 7 September 1707; DIED: Paris, France, 16 April 1788) *French naturalist & biologist.*

Buffon was from 1739 he was keeper of the Jardin du Roi (later the Jardin des Plantes) in Paris and made it a center of research during the Enlightenment. He devoted his life to his monumental *Histoire Naturelle* (44 vol., 1749-1804), a popular and brilliantly written compendium of data on natural history interspersed with Buffon's own speculations and theories. Of this work, the volumes *Histoire Naturelle des Animaux* and *Époques de la Nature* are of special interest. His famous *Discours sur le Style* was delivered (1753) on his reception into the French Academy. He also contributed to the mathematics of probability.

Buffon's *Natural History, General and Particular* for the first time presented a survey of the whole of natural science in a popular form. It is a monumental work, justifiably praised, containing information on almost every topic of 18th century natural history. It is also brilliantly written and through its diversity of topics, originality and richness of thought, it became an authoritative voice until the time of Darwin.

In 1739 Buffon became director of the Jardin du Roi (now Jardin des Plantes). In this position he began a catalog of the collections, but soon developed the project into a complete study of nature that was unlike anything previously known in the literature. It is among the first scientific works to present its ideas in an autonomous way, free from religious influence. As such the idea is developed that the earth and nature have developed over a very long period of geological time, and with in this intellectual framework, botany, paleontology, zoology, geography, mineralogy, etc are described.

Beginning first with the help of his assistant, LOUIS DUBOIS, and later with other collaborators, but always under his careful stewardship and control, this vast publication was advertised in a prospectus circulated in 1749. In it Buffon outlines the scope of the project, the method of preparation, the number of volumes (Buffon envisioned 15 volumes, but the completed work is 44 volumes), the contents of each volume, their illustrations, etc. Even though it was an expensive set to publish, the *Histoire Naturelle* proved to be a financial and popular success that is shown by the frequency with which the work was reissued and translated. However, it is this popularity that makes the bibliography of it various editions, issues, and translations a torrid problem. To the original work were published supplemental volumes that are usually not included in later printings of the text. Also, the individual sections on birds, animals, minerals etc. were often times published as stand alone works for buyers not interested in purchasing the complete and expensive set. This all makes the complete bibliography of Buffon's *Histoire Naturelle* a knot that may never be fully unraveled.

962. Prospectus, 1749: Histoire Naturelle, Générale et Particulière, avec la Description du Cabinet du Roy. Paris, De L'Imprimerie Royale, 1749.

4^o: [2], 8 p., large woodcut vignette on title.

EXTREMELY RARE. The Prospectus for the *Histoire Naturelle*, written by Buffon himself, announcing to the world the publication of his revolutionary natural history work. It was to present “for the first time a complete survey of natural history in a popular form...[Buffon] was the first to present the universe as one complete whole and to find no phenomenon calling for any but a purely scientific explanation.” (Printing and the Mind of Man). Here the project is outlined, with Buffon envisioning 15 volumes to complete the text, the methodology followed, the contents of each volume, types of illustrations, etc. He emphasizes that the appearance of each volume will resemble the prospectus. At the conclusion, are listed the two booksellers – Durand and Pissot – through whom copies of the work could be obtained.

HISTOIRE NATURELLE, 1749

963. — French, 1749-1804 [First edition].

Histoire	Naturelle,	Générale Et Particuliere.
Avec La Description	Du Cabinet Du Roy.	

[double rule] | Tome Premier. | [double rule] |
[ornament] | A Paris, | De L'Imprimerie Royale |
[rule] | M. DCCXLIX.

44 vols. in 45, 4^o, with engraved vignettes on the titles of the first 15 vols., headpieces, and 1279 engraved plates including engraved portrait frontispiece (in vol. I of Supplément), 12 maps, and 4 folding tables.

VERY SCARCE. **REWORK THIS ENTRY.** Buffon devoted his life to his monumental *Histoire Naturelle*, a popular and brilliantly written compendium of data on natural history interspersed with Buffon's own speculations and theories. Besides the comprehensive coverage of natural history (including mankind) and minerals, the work incorporates Buffon's highly important *Théorie de la Terre*, elaborated in the fifth volume of the *Supplément* under the title *Des Epoques de la Nature*.

"Buffon's work is of exceptional importance because of its diversity, richness, originality, and influence. Buffon was among the first to create an autonomous science, free of any theological influence. He emphasized the importance of natural history and the great length of geological time. He envisioned the nature of science and understood the roles of paleontology, zoological geography, and animal psychology. He realised both the necessity of transformism and its difficulties. Although his cosmogony was inadequate and his theory of animal reproduction was weak, and although he did not understand the problem of classification, he did establish the intellectual framework within which most naturalists up to Darwin worked." (DSB)

Buffon is considered the founder of evolutionary theory. "Georges Buffon set forth his general views on species classification in the first volume of his *Histoire Naturelle*. Buffon objected to the so-called "artificial" classifications of Andrea Cesalpino and Carolus Linnaeus, stating that in nature the chain of life has small gradations from one type to another and that the discontinuous categories are all artificially constructed by mankind. Buffon suggested that all organic species may have descended from a small number of primordial types; this is an evolution predominantly from more perfect to less perfect forms." (Parkinson, *Breakthroughs*)

Like that other great product of the enlightenment, the *Encyclopédie*, the *Histoire Naturelle* was a collaborative enterprise, outliving its instigator and chief author. The two scientists who were foremost among the several contributors were DAUBENTON and Lacepede (first as Comte de, then as Citoyen): they completed the work after Buffon's death in 1788.

Over 1,000 of the plates are the work of Jacques de Seve, pere et fils: a full list of the artists is provided by Nissen. They range in style from exact anatomical drawings (skeletons, dissections, etc.) to settings of animals in their natural habitat. The headpieces are fanciful masterpieces of baroque decoration.

In spite of the costliness of the work, its numerous editions and translations testify to its popularity. Most

sets lack some or all of the Supplement volumes, and/or various plates. For clarity, below is a breakdown of the various sections of the work:

Histoire Naturelle, Generale et Particuliere, avec la Description du Cabinet du Roi, 15 vols., 1749-67. *Histoire Naturelle des Oiseaux*, 9 vols., 1770-83. *Histoire Naturelle des Mineraux*, 6 vols. (the sixth vol. is the maps bound separately), 1783-88. *Supplément a l'Histoire Naturelle*, 7 vols., 1774-89. *Histoire Naturelle des Quadrupedes Ovipares et des Serpens*, 2 vols., 1788-89. *Histoire Naturelle des Poissons*, 5 vols., An VI-XI (1798-1803.) *Histoire Naturelle des Cetaces*, 1 vol., 1804.

The *Histoire Générale* was a widely reprinted and translated work. Sometimes only individual sections were produced, other times the complete work appeared. Listed below are a spattering of these editions and translations known (or thought) to contain the mineralogical section.

964. Another edition, 1749-67: *Histoire naturelle, générale et particulière, avec la description du Cabinet du Roi*. Paris, de L'imprimerie nationale, 1749 [-1767].

15 vols. 4^o: [6]-612, [4]-603, [4]-530, xvi-544, [4]-311-[1], vi-[2]-344, [4]-378-[1], [6]-402-[1], [6]-375-[1], [8]-368, [4]-450-[1], [6]-xvi-451-[1], [6]-xx-441-[3], [6]-411-[1], [6]-411-[1], [6]-207-cccxxiv pp. et 579 pll. et 1 tableau dépliant (qqs petits trous de vers aux tomes I et X). VERY SCARCE.

965. Another edition, 1766-99: *Histoire Naturelle, Générale et Particulière, avec la Description du Cabinet du Roi ... Nouvelle Édition*. Amsterdam, 1766-99.

38 vols. Various publishers are: Amsterdam, J.H. Schneider, 1766-79 (21 vols.) and Dordrecht, A. Blussé et fils., 1795-99 (17 vols.). 4^o, engraved portrait by J. Houbraken after Drouais, 1137 plates (8 folding) & 12 maps (10 folding), 31 title vignettes and 38 head-pieces, by C.F. Fritsch, B. de Bakker, C. Buys, J. van Schley and others. All finely hand-colored. PAGE SIZE: 298 x 242 mm.

RARE. This item represents a tall set in its rarest and most costly state, with the meticulous hand-coloring adding another dimension to the fine plates. The periodic avis to the subscribers mentions copies on *grand papier*, but there is no mention of hand-coloring. Landwehr, in his notes to the first edition in Dutch, quotes contemporary source that mention four issues: normal paper, large paper, copies with colored plates and (most expensive of all) copies with plates and vignettes hand-colored.

The set was published and bound in five different sections: *Histoire Naturelle* (15 vols.; Schneider, 1766-71), *Supplément* (7 vols.; vols. I-VI, Schneider, 1774-79 & vol. VII, Blussé, 1799), *Oiseaux* (9 vols.; Blussé, 1796-1795-1799), *Mineraux* (5 vols.; Blussé, 1798-9), and *Ovipares et Serpens* (2 vols.; Blussé, 1798-9). The correct number of plates is problematic: Nissen calls for 1130 plates and maps. Other sets have been sold with 1144 and 1156 plates and maps.

With all the plates in beautiful Dutch contemporary colouring, this work is one of the rarest and most beautifully produced natural history works published in the Netherlands. The list of subscribers which is found in volume 8 lists only 2 coloured large paper copies, one for Daum, banquier à Berlin (pour un exple sur grand Papier & enluminé) and the other one for M.L.P., all others were

BUFFON

uncoloured. The total number of copies printed did not exceed 200, a few large paper copies were issued and even fewer 'illuminated' copies. The price of a coloured copy was about fl. 600 which makes it one of the most expensive Dutch natural history books of the 18th century. The most expensive work was a coloured copy of Seba at fl. 800.

The present 'l'Allemand' edition is the only quarto edition to rival the original French Imprimerie Royale edition (1749-1804) in 44 volumes. It does not contain the later published volumes by Lacépède on fishes and whales, as these were published after the date of above edition, it however contains numerous additions by l'Allemand which were included in the later French Buffon editions. All plates are after drawings by de Sève, the famous French landscape painter. The animals are depicted in their natural habitat, amidst charming landscapes, villages, rivers, mountains etc. These elaborately drawn plates, full of elegance, became exceedingly popular and have often been copied by later artists. They have an artistic liveliness which is somehow lacking in the the work Martinet made for Buffon's 'Planches Enluminées'. "Buffon's work is of exceptional importance because of its diversity, richness, originality, and influence. Buffon was among the first to create an autonomous science, free of any theological influence. He emphasized the importance of natural history and the great length of geological time" (DSB).

615 p., 2 folded maps, 6 folded plates (Epoques de la
Nature). PAGE SIZE: 260 x 210 mm.

VERY SCARCE. A French naturalist and
cosmologist; Buffon (1707-1788) is best noted for his
monumental work *Histoire Naturelle*, published in 44
vols. between 1749 and 1804. His writings contain
an evolutionary theory for animal and plant life, and
most importantly his volume "Epoques de la Nature"
contains the description of the origins of the earth and
other planets from comet impact with the sun and
solidification from a molten state. Buffon points out the
long chronological history of the earth that is recorded
in the rocks. Volumes in the set cover the histories of
the earth, man, animals, plants, and minerals. Many of
the volumes pertain to the quadrupeds. The volumes
offered above are the first edition of those which pertain
to the theory of the earth.

VERY SCARCE. Perhaps the greatest publication of the French enlightenment of the 18th century was Buffon's *Histoire Générale et Particulière* (1st ed., 44 vols., Paris, 1744-1804). "Buffon's work is of exceptional importance because of its diversity, richness, originality, and influence. Buffon was among the first to create an autonomous science, free of any theological influence. He emphasized the importance of natural history and the great length of geological time. He envisioned the nature of science and understood the roles of paleontology, zoological geography, and animal psychology. He realized both the necessity of transformism and its difficulties. Although his cosmogony was inadequate and his theory of animal reproduction was weak, and although he did not understand the problem of classification, he did establish the intellectual framework within which most naturalists up to Darwin worked" (DSB).

This encyclopedia work provided comprehensive coverage of all aspects of natural history, including the realm of minerals. In the first edition, mineralogy was covered in five original volumes together with three supplemental tomes. In this 'Nouvelle Édition' the five original volumes have been bound up into two physical books. The minerals are arranged according to a scheme that assigns them to three classes of rock. Namely, (1) those created by primitive fire (=igneous rocks), (2) those created by secondary actions of heat like basalts, lava and ash deposits, and (3) those created by sedimentary processes. The first volume begins with the classification scheme and includes quartz, jasper, mica, talc, fluorite, tourmaline, granite, schist, alabaster, marble, and others. The second volume describes a wide variety of 'secondary' types including volcanic ejecta, salts, sulfur, alkalis, niter, borax, iron gold, etc. Volume three contains descriptions various metals and their minerals including lead, copper, silver, mercury, antimony, bismuth, zinc, platinum, cobalt, etc., as well as descriptions of stalactites, quartz crystals, various gemstones, and concluding the volume a tabular arrangement of the minerals according to their physical properties. Volume four contains descriptions of jaspers,

concretions, jade, serpentine, turquoise, petrifications & fossils, zeolites, pyrites, hematite, etc. The fifth volume describes magnets and magnetism especially as it applies to the earth's magnetic field. Accompanying this volume are a large number of tables listing various voyages, dates, longitude and latitudes.

977. — English, 1792.

Buffon's *Natural History*, Abridged. Including the history of the elements, the earth, mountains, rivers, seas, winds, whirlwinds, waterspouts, volcanoes, earthquakes, man, quadrupeds, birds, fishes, shell-fish, lizards, serpents, insects, and vegetables. London, Published for C. and G. Kearsley, 1792.

2 vols. [VOL 1] 8°: xl, 353 p. [VOL 2] 8°: 493 p. Illustrated with copper engravings, of which a few are folding plates: 107 numbered plates, engraved title-pages in each volume, and a frontispiece in volume 1. VERY SCARCE.

978. Another English edition, 1807: Buffon, Georges Leclerc, Comte de Buffons *Natural History*. London, H.D. Symmonds, 1807-1808.

16 vols. 12°: 130 full page hand coloured plates.

VERY SCARCE. Each volume is signed by Thomas Peacock, who bought the books new and had them bound for his private collection.

Containing a theory of the earth, a general history of man, of the brute creation, and of minerals, vegetables, etc. (10 volumes). Together with; natural history of birds, fishes, insects and reptiles (6 volumes). Sixteen volumes uniformly bound in contemporary early 19th Century half leather onto marbled boards; the spines have six gilt edged panels with contrasting red and/or orangey brown title labels with green leather volume indicators. The set is the complete Barrs edition.

London, H.D. Symmonds, 1807-1808 respectively. This set contains a total of 130 full page hand coloured plates. 12 mo.

A scarce and complete set of this English translation of the famous French work published earlier in Paris: *Histoire Naturelle, Generale et Particuliere, Avec la Description du Cabinet du Roi*.

engraved plates and 2 folding maps. PAGE SIZE: 166 x
93 mm.

VERY RARE. One of the great milestones in the
history of earth science, in which Buffon suggest for the
first time the great age of the earth. Buffon was an
extremely influential French natural philosopher whose
extensive works included one of the last speculative
cosmogonies: *Les Époques de la Nature* (1778).
Beginning with the formation of the Earth, it covered
seven epochs in analogy to the seven days of Creation.
He proposed that the Earth was hot at its creation and,
from the rate of cooling, calculated its age to be more
than 100,000 years.

This is the first separate edition, of a text that
first appeared in quarto in the fifth volume of the
Suppléments, to Buffon's *Histoire Naturelle* in 1778. In
this 12° edition the notes are incorporated as footnotes
(having been relegated to the end of the book in the
quarto edition), and there is a new Table Alphabétique.

BUONANNI (Bonanni), Filippo. (BORN: Rome, Italy, 7 January 1638; DIED: Rome, Italy, 30 March 1725) *Italian theologian & conchologist*.

Buonanni entered the Jesuits in 1654 and became a pupil of Athanasius Kircher at the Collegio Romano. After completing his education, Buonanni taught first in the Jesuit college in Orvieto and then in the one in Ancona. He was called back to Rome in 1676 to be the Archivist of the Casa Professa, Il Gesua. He was appointed Rector of the College of the Maronites in Rome, 1695-1725. In 1698, he also accepted an appointment as the

curator of the Kircherian Museum at the Collegio Romano. Buonanni collected shells of sea life, which he classified and interpreted within an Aristotelian framework. He believed in their spontaneous generation. Some of his observations employed a microscope, which he had built himself.

PLATES: Frontispiece portrait of Ruspolo engraved by
Arnold van Westerhout after Antonio David.

RARE. First detailed and illustrated catalog of
the famous Museum Kircherianum of the Jesuit Colle-
gio Romano after its rebirth in the early 18th century.
GIORGIO DE SEPI had previously published a glimpse of
the Museum at its height in 1678. Kircher had originally
built the collection on a collection previously assembled
by Alfonso Donnino [—1651], and utilized the net-
work of Jesuit missionaries to provide new specimens of
natural and ethnographic wonders from all the lands of
the world. Kircher also had a passion for Egyptian an-
tiquities including two authentic mummies, a collection
of exotic shoes, and the first cuneiform tablet recorded
in Europe. However, after Kircher's death in 1680 the
collection languished for years before Buonanni was ap-
pointed curator.

Buonanni resurrected the collection and revital-
ized its importance by moving it to a new building and
again adding extensively to its contents. Here he pro-
vides a detailed account of the objects and the genesis
of the museum. As a conchologist himself, he devotes a
large part of the text and 48 plates to illustrating 412
specimens of shells. There is also a section devoted to
microscopes and microscopic views. Buonanni's catalog
gives a good idea of the museum contents contained at
the time. It is a magnificent production and makes
it clear why scientific visitors continued to visit the
Museum Kircherianum. The plates comprise figures of
Greek, Roman, and Egyptian antiquities, fossils, shells,
animals, plants, waterworks, etc. Also illustrated is a
Magic Lantern, the invention of which is attributed to
Kircher.

[Vol 2] I-XLVIII, Shells and bivalves.

VERY SCARCE. Revised and edited by Giuseppe-Antonio Battarra [see note below]. Kircher, the great German Jesuit scholar, had formed during his life a magnificent collection of antiquities and natural history specimens. When he died in 1680, the collection was bequeathed to the Collegio Romano. Although Buonanni published a one volume account of the collection in 1709, this much enlarged work is the definitive edition. The volumes cover mainly zoology, paleontology, and conchology, and are superbly illustrated. It is one of the most important accounts of a seventeenth century scientific cabinet.

Volume 1 divides the text into classes of (1) quadrupeds, (2) reptiles and insects, (3) fossils, minerals and stones, (4) fish and sea creatures, and (5) apparatus. Pages 94-152 describe the mineralogical specimens, including gold, silver, copper, iron, lead, tin, mercury, antimony, magnets, marcasite, salt, sulfur, amber, dendrites, fossils, the Philosopher's stone, etc. Some of these are illustrated on plates XXXV-XXXVI. Volume 2 deals almost exclusively with shell and bivalve descriptions.

Giuseppe-Antonio Battarra. (BORN: Coriano, Italy, 1714; DIED: Rimini, Italy, 1789) *Italian cleric & botanist.* Born to a lower class, Battarra entered the seminary of Rimini in 1738 to improve his prospects. After instruction from Giovanni Bianchi, in 1741 he was called to teach philosophy at Savignano. In 1748, he was transferred to Rimini, where he remained.

blank.; [1]-524, Text.; [525]-527, "Table Des Matières."; [1 pg], Blank.

VERY SCARCE. Volume 1 is a textbook on applied geology. Volume 2 is a textbook on the exploration of mines. Both volumes make use of elaborate steel engravings to illustrate concepts put forth in the text. These illustrations are exceptionally good. Volume 2 shows for example drill bits, underground scenes, mining techniques, waste rock management, wenchers & hoists, picks, etc.

VERY SCARCE. The first portion of the volume comprises a general introduction to mineralogical science, focusing on the applied aspects. This introductory material is divided into 5 chapters that provide overviews on the physical characters, crystallography, applying crystallography in species determination, chemical qualities, nomenclature and classification. The remainder of the book provides a descriptive mineralogy of the most common minerals and those of economic importance. Complementing this section are many fine steel engravings some being of actual mineral specimens. These illustrations belong to the finest black and white depictions of mineral specimens ever produced by none photographic means.

BUSHELL

BUSHELL, Thomas. (BORN: Cleve Prior, Worcestershire, England, 1594; DIED: April 1674) *English mining expert.*

Bushell was educated at Baliol College, Oxford. He was afterwards in the service of Lord Chancellor Bacon, on whose disgrace he retired into Oxfordshire, to reside on his estate. He was strongly attached to the royal cause, and had the honour to entertain Charles I. and his queen at his seat at Road Enstone, near Woodstock, in 1636, when he submitted his celebrated water-works to them with much pageantry, and many speeches and songs took place. Dr. Plot gives a long description of the place. For his services to the king he was made Master of the Royal mines in Wales. In this new appointment he, by permission, established a mint at Aborecky in conjunction with Lord Godolphin, and coined money, which he sent to his sovereign at Oxford. Their mine yielded at one time one hundred pounds worth a week of silver, besides half as much lead.

AN EXCERPT, 1660

BUTTGENBACH

1011. — English, 1660.

An Excerpt | By | Mr. Bushell | Of His Late |
Abridgement | Of The | Lord Chancellor | Bacons
| Philosophical | Theory in Mineral Presecutions.
| [rule] | Published for the Satisfaction of his Noble
Friends, that impor- | unately desired it. | [rule]
| London, | Printed by Tho. Leach, in the Year,
1660.

8°: [4], 54 (i.e., 52), [14], 9-40, [1] p., illus.

CONTENTS: [2 pgs/=A1], Title page, verso portrait.; [2 pgs/=A2], "Dread Sovereign."; [1]-6/=A3r-B1v, "My Lord and Gentle-man."; 7-9/=B2r-B3r, "Mr Bvshel's | Letter | To the Right Honourable the | Lord Fairfax | Touching his | Articles of VVar."—dated 18 April 1659.; 9-10/B3r-B3v, Other letters.; 11-14/=B4r-C1v, "To the Right Honourable | William Lenthal | Speaker to the | Parliament."; 14-22/=C1v-D1v, "Mr Bushel's Mineral Overtures."—dated 4 July 1641, illustrated on page 22 with "A table..."; 23-54 (i.e., 52)/=D2r-G4v, Text of more letters.; [7 pgs], "The Case of the Mine Royal judged to be the most | learned Lawyers under their hands."; [1 pg], Blank.; [2 pgs], "Die Sabbati 14. Aug. 1641."; [4 pgs/=†1r-†2v], "The Miners Contemplative Prayer..."; 9-16/=*1r-*4v, "An Abridgement of my Lord Bacon's | Atlantis."; [1 pg], "The Impressa of Mr. Golden Medal." with an illustration of the medal and at the bottom of the page "Finis."; [1 pg], Blank.; 17-36/=G3r-I4v, "Post-script to the Judious Reader."; 37-38/=X1r-X1v, "A Sonnet..."; 39-40/=K2r-K2v, "A Sonnet Sung...", ending "Finis."

VERY RARE. This very curious book contains a portrait and impression of Mr. Bushell's "Golden Medal." In the *Bookworm* (1869), is a very interesting notice of these tracts, which leaves no doubt in the mind of the writer of the article that Bushell "was the canal through which ran the fortunes of Lord Bacon to be sunk in unprofitable mining schemes." The article is illustrated by an engraving of the Golden Medal.

1014. — German, 1710.

Rudera Diluvii Testes, i.e. Zeichen und Zeugen der Sündfluth, in Ansehung der itzigen Zustandes unserer Erd- und Wasser-Kugel, insonderheit der darinnen vielfältig auch zeither im Querfurtischen Revier unterschiedlich angetroffenen, ehemals verschwemten Thiere und Gewächse, bey dem Lichte natürlicher Weissheit betrachtet und nebst vielen Abbildungen zum Druck gegeben. Leipzig: Johann Friedrich Braun, 1710.

4°: [8], 314, [20], [2] p., engraved frontispiece, XXX leaves of plates (some folded). Includes index. Title page printed in red and black. PAGE SIZE: 194 x 150 mm.

VERY SCARCE. An early work on geology and fossils by a Lutheran pastor near Leipzig. The plates show fossils, minerals, and two sections of the earth after Kircher. The text concerns the fossil evidence of the biblical Deluge.

First edition, rare, of this study of the fossils of Querfurt in Saxony, considered as 'relics of the universal deluge'. Büttner (1660-1719) deacon of Querfurt, was a theologian and naturalist, and wrote this work in order to demonstrate that fossils were the remnants of the Flood. 'Büttner ... was firmly convinced of the diluvial origin of fossils, and was strongly opposed to those who attributed these "reliquiae diluvianae" to either the "lusus naturae" or the spermatoc principle. Büttner, in his Treatise on the Deposits which are Evidence of the Deluge, refers in surprisingly scurrilous terms to Lhwj and his animalculae' (Melvin E. Jahn and Daniel J. Woolf in *The Lying Stones of ... Beringer*, p. 178).
